described a little further down the posting.

Now the setup, I am still green, so correct me anywhere it sounds wrong:

It's a TS-520. With this rig, as I read it on the antenna tuner
(AT-230), on a dummy load, I can output 82 watts on 14.235 and 98

watts on 7.235. To get a steady meter measure, I keyed a constant tone (from a cw oscillator) into the open mic (Astatic D104).

(I tell ya, it takes four hands to do this or weigh down something. If there's a better way to do this, let me know!)

Meanwhile, I tweaked the plate current and sometimes the load, until the meter read the maximum power output I could get. This is assuming everything else is in place and tuned properly.

I peak at 150 watts in normal use.

The SWR is less than 1.5:1 on everything I've worked so far. Even for an "automatic antenna tuner" I find myself still constantly tweaking the R-Tune, X-Tune. Kind of a pain if you have to constantly speak on the air to tune. If there's an easier way for this too, I'd like to have it!

Now, the antenna. It's an MFJ 1779B, 80-40 meter SSB Dipole. I have it cut to 34' feet each side. That seemed to be best for 40 meter and seems to work for 20. Isn't about 65' the full-wavelength for 40 meters?

Anyway, the antenna is stretched along the property fence, held in place with plastic cable pins, and only about FIVE feet above ground.

I'm told this essentially makes it NVIS. The antenna is straight, horizontal, pointing N/S.

That's the entire antenna system I have. It might be okay for some applications (like skip zone), and I'm not expecting any DX with it. My next antenna `upgrade', which I'm sure could be another forum, is a wire loop around the house eaves. My third, methinks is the Gap Titan DX. Your opinions on any of these?

So, in summary; What's wrong with my picture?

Well, I'm sure everyone's in tears, either from the long email or my humorous antenna, but I do appreciate the help in my call-to-action.

Frank, K2NCC

PS In my nine months as an amateur radio operator, I've quickly learned that the ham radio community tends to attract good people.

Thank you.

Well, my limitation is that my house is small, on a small lot. I can put up an inverted V, but it would have to be on the side of the house as I have nothing in which to tether it. I'm concerned about RF with the few options I have. That's why I've been considering a 200' loop around the roof.

> Third a 20m dipole made from any copper wire u can find cut
> to a 1/4 wave on each end will work better than what u have.

Doesn't the 40 meter dipole I have 20 meters? Isn't 20 meter about 33 feet? Don't I have 2 wavelengths on 20 meter?

Granted, I still need height. But even if I get another antenna up, I'll probably keep this one in place for reaching skip zone.

> fourth: get a cheap key or even two wires wired to a plug for
the key

I have the practice oscillator/cw from MFJ. In a pinch, the key can be connected to the rig. Can I turn the Mode to CW and key up the mic for similar results?

> fifth, try a little cw in the old novice subbands, lots of guys
that send

Granted, I do need CW practice, but my cruising speed was around 16. Passed in the military at 22.

Good Morning Walt;
I just read your posting about the watt meter, interesting that
at our club meeting the other night we had the TC for NLI (K2LJH)
give a very informative talk about installing radios in cars. One
of the things he mentioned was that on a lot of meters the accuracy
is sometimes on the order of plus or minus all the way up to 10%!
He gave a very good talk, basically a lot of radios on the
market now are very happy with a 2/1 SWR, he did end up by saying
that if you wanted accuracy you had to pay for it, he did mention
using a Bird and there were a lot of blank stares from a lot of the
people in the club, he had to explain what a Bird meter was. Please
keep up the very informative articles.

Kenwood MC-50 desk mikes are on Ebay most of the time, for 50 to $60.
Ken's Electronics at
http://www.kenselectronics.com/lists/mics.htm#Amateur
sells a hand mike for $29.

I use the Astatic D104 and it seems to work better than the MC-50 did,
for about the same price. Even the hams I've spoken with regarding
mics prefer the Astatic over the Kenwood mic. I bought mine on eBay,
withe the amplifier stand (UG8), cabled and ready for my boat anchor
for about 50 bucks.

Frank,
Moved to a home 6 years ago where I can't erect a beam. I've been using a large horizontal wire loop fed with ladder line and a manual antenna tuner ever since. It works very well on all HF bands, even for DX. This is now my only antenna. I'm able to work into Europe, Asia, South America and the Pacific with my TS-530s. I even broke through the pile-up and worked Peter 1 island, 3Y?X on 17 meters.

Was wondering why none of the Kenwood Hybrids do AM.

Looking through the circuit description, to get USB/LSB they first generate double sideband (DSB/AM) and then filter out the USB/LSB that they don't want.

If they generated DSB/AM then why didn't Kenwood offer that mode on the Hybrids?

I like the idea of a horizonal loop, but I have no place to tether it.
My tallest point on the entire lot is about 22'!

Well, someone gave me the idea, which in hindsight should have been
obvious, was to check my SWR with the antenna tuner in THROUGH to see
what my 'real' SWR is.

Oh my. I'm banging 10:1 and over on every band! Horrible. So, even
w/the tuner doing what seems to be a good job, it worries me that the
untuned resonance (?) is so far off ideals.

What should be the first thing I look at to fix this, if it's a problem?

Summary of my antenna: It's a dipole, cut 34' on each end (total 68'
length). It's connected to the tuner via a RG8 50 ohm cable, 50 feet
long. The excess is coiled. I guess it would be called center fed
since the coax connects to make a 'T' on the antenna. It's a single
band dipole. It was originally an 80-40 meter length. I cut it to
what comes out to about half it's orginial length. The online dipole
calculators say that the legnth I cut is is appropriate for 40 meter,
and I would assume, fine for 20 or 15 meter too. Please correct me if
I'm wrong in any of my assumptions!

I've also been told to make it a inverted 'V', but again, my lot
layout doesn't allow me to tether to anything. I'm also concerned
about RF if I put it on the house.

Thanks for the input Steve. Let me know what you guys think so far.

Frank,
If your dipole is cut for 40 meters you should have a low SWR on that band and it should work OK on 15 meters also, but not 20 unless you use an antenna tuner. If you want to use it on all bands you should use your antenna tuner and feed the antenna with open wire line or ladder line. Using the antenna tuner just makes your transceiver see 50 ohms even though the SWR on the feed line is high. With coax you will have quite a bit of loss in the feed line with a high SWR. Open wire line or ladder line has much, much lower loss even with a high SWR. If you are getting a 10:1 SWR on 40 without the tuner and your antenna is cut for 40 meters, then there is a problem with your antenna or coax or the connector.

With SWR over 10:1 something is basically wrong -- cold solder joint, bad Pl-259 connector, break in feedline, connected to wrong antenna jack in tuner, bad jumper cables to tuner, no ground, etc. You fence isn't metal is it?

I'd check the feedline and then the antenna out with an ohmmter to make sure it's solid.

You can check your antenna lengths here.
http://k4far.home.att.net/calc.html

Good luck!

Okay, I've rechecked all connections, and verified continuity/ground on the connections w/a multimeter.

I re-calibrated the antenna tuner, which I'm still uncertain if it's right, and I still get 10:1 or worse. That's with it in THROUGH. On 40 meters. What might be failing is my adjustment of the tuner. The manual says "With a minimum of transmit power, adjust the CAL control so the meter pointer deflects to the CAL mark." I just key up on

I've reconnected all grounds, which goes into the ground bar in the garage, where I have everything.

So, I'm still stumped as to why my SWR is so high.

> If you want to use it on all bands you should use your antenna tuner and feed the antenna with open wire line or ladder line.

Replace the coax with a ladder line or open wire? While leaving the dipole in it's place? If I understand correctly, I'll do that soon.

> on 40 without the tuner and your antenna is cut for 40 meters, then there is a problem with your antenna or coax or the connector.

I've changed cables and double-checked everything I know how. Which is limited.

Sorry if this email seems a broken sentence after another. As I did things, I typed them in.

I changed cables, even though they're new. Everything shows
continuity and the ground seems okay. I just reconnected the ground
line, one from the radio and one from the tuner to the ground stake.
I had it daisy-chained, from radio to the tuner to the ground, but was
told not to, in spite of what the manual says.

> You fence isn't metal is it?

OMG that made me laugh out loud! No, it's wooden, but I can see how a
metal fence might affect it. Good question.

> I'd check the feedline and then the antenna out with an ohmmter to
make sure it's solid.

Well, I checked continuity. What other things can I test with the
multimeter? What results will I be looking for?

> You can check your antenna lengths here.
> http://k4far.home.att.net/calc.html

Done. Shows that I need a dipole between 64 and 67 feet to work the
40 meter. As a 1/2 wave length dipole. My 68 feet dipole too long
maybe? Would trimming the antenna back six inches on each side make
that much of a difference?

Frank, K2NCC

7138. TUNE

Okay, it seems like I have the antenna tuner calibrated correctly now.

I switched the 520 to TUNE, and key'd the mic and now get 1:1 on 40 meters with the antenna tuner enabled.

With the antenna tuner in bypass (THROUGH) mode, I get a 5:1 on 40 meters. Still seems high.

Kenwood Twins 599 series are "hybrids" and can do AM/SSB/CW. Actually they do AM very well and sound great on AM. With the addition of an interconnecting cable, they function as a transceiver.

Pete, wa2cwa

On Sat, 01 Apr 2006 22:19:04 -0000 "ke9zm" <ke9zm@...> writes:
Was wondering why none of the Kenwood Hybrids do AM.

Looking through the circuit description, to get USB/LSB they first generate double sideband (DSB/AM) and then filter out the USB/LSB that they don't want.

If they generated DSB/AM then why didn't Kenwood offer that mode on the Hybrids?

HI Ron. I use the MC-50 and D-104 on several rigs, and I agree with those recommendations you have received. In addition, I also use the Shure 444 mic with my Kenwoods and Collins radios. My personal preferences would be the high impedance (original) D-104 or the Shure 444. Both these are regularly found at hamfests, on ebay, and on many other ham radio listings. The Shure 444 is a little hot for the Kenwoods, so I added a 10dB attenuator in the base - which is simply 3 resistors. Have fun.

Kenwood MC-50 desk mikes are on Ebay most of the time, for 50 to $60.
Ken's Electronics at
http://www.kenselectronics.com/lists/mics.htm#Amateur
sells a hand mike for $29.

The calculation of diplole length from a formula is just an approximation. Depending on your enviroment it may to be too long or too short.

Find the actual resonant point (or low swr) to determine if the resonant point is high or low from what you want. If the measured resonant point is lower than you want then you need to shorten the antenna. If the measured resonant point is higher than you want then you need to lenghen the antenna.

Best thing from the start is to cut it longer than you need and then work your way to the resonant point in steps. You can start at a longer length, measure the resonant freq, and then cut 1 inch from each end and measure again. What you are doing is calculating KHz per inch. Once you have this, you can calculate (approximate) what the actual (close to the actual) length should be and you can approach that in a couple/three steps.

Bottom line, calculated dipole lengths are approximate and you will have to refine that lengh by experiment, trial, and error.

Don't I need an antenna analyzer for this measurement? If not, what are my steps?

Seems like I just need to get another antenna up, but before I do that, I wanted to be sure that it would make enough difference w/the equipment I have.

I've been reading through these notes and I wonder if there's really a problem - or at least a problem that anyone needs to be concerned about.

I run a doublet - 125 foot center fed with 600 ohm ladder line. You'd be horrified to see the SWR when I bypass my tuner. This antenna works well on all bands from 80 through 10 meters except 17... always on the tuner.

I believe that high SWR is more an issue with coax fed antennas as the coax has significantly more loss than ladder line. If you are running coax, I'd suggest trying something like the widow line (450 ohm?) to feed your antenna. You'll need a balanced input on your tuner or a balun to get it back to 50 ohm unbalanced. Keep any coax lengths short. With a setup like that, I'd forget about the antenna SWR and just use the tuner to make the rig happy.

Many people swear by resonant antennas. I'll take my all-band doublet over single-band, trap or fan antennas any day.

73,
Kevin - K4VD

From: Walt Breining
Topic: 7131 Message: 7148

During the late 70's, there was not much interest in H.F. AM with Radio Amateurs. The method of using filtered DSB with a carrier was not popular with those who were using AM. They preferred to use their olde plate modulated rigs for good reason.

Kenwood was not interested in their Amateur Radio gear being used illegally in other radio services. The cost of adding the additional switching and receive detector circuitry for AM was not economically feasible and it avoided misuse of their Amateur Radio equipment by non Amateurs, which was an issue with some of their Amateur Radio customers in those days.

The revival of AM in Amateur Radio came later as some of the olde gear became of nostalgic interest. While it can be made to sound good, DSB pseudo AM has some disadvantages over screen and plate modulation. The warm full sound that the olde AM rigs had can not be easily be accomplished with pseudo modulation because of the filter slopes. The filter rolls the low frequencies off. With screen and plate modulation, there is no filter.

As a point of interest, some of us have discussed the possibility of bringing the screen voltage out of the back of an FT-101 Yaesu, modulating it with a transformer or a series modulator and sending it back into the rig. The FT-101 does have AM receive capability and sounds pretty good if a 6 or 10 kHz AM filter is installed.

Now I am starting to drift off topic here and away from the original question. We probably should take any further discussion of AM other than that directly related to the Kenwoods to AMinternational or one of the Fox Tango groups.

And please do not start a thread on the non amateur use of Amateur gear pro or con. I just wanted to answer the question fully.

The TS-830M, with AM capability, was also in the market along with the TS-830S, but was not sold in the U. S. They both used the same IF board, included a 6 KHz filter for AM, and a small additional board with some components, relays, etc. to provide the AM functionality. Output was generally around 25 watts in the AM mode. The "CW Wide" on the function switch of the 830S became the AM position on the 830M. As soon as Kenwood introduced their all solid-state HF rigs, AM was part of the functionality. The service manual for the 830S also includes the AM board addition for the 830M. There was some misguided attempt by a number of people during the late 70's to "kill" AM once and for all. Fortunately, many AM operators held their position and resisted the attempt. Now the majority of all HF rigs include the AM mode and with DSP functionality and state of the art phasing type AM modulation, most today should just as good, if not better, then the plate modulated rigs of the 50's.

You don't need an antenna analyzer. Just make SWR measurements at the low end and at the high end of the part of the band you are licensed for. The goal is to find out if a lower SWR is found at the low end or high end of the band and from that determine if you anttenna is too long or too short. If the high SWR is constant across the band then the antenna is way off or there is some other problem not related to the length of the antenna.

7153. Desk Mic: MC-50 PTT Switch Noise

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-02 18:55:38 UTC
From: Mike Lewis
Topic: 7122 Message: 7153

Hello everyone,

This is my first post to the group. I'm assembling a TS-530S station as I study for my General. I am enjoying reading the comments here about these find Kenwood transceivers.

I bought a very good condition Kenwood MC-50 mic last week and noticed one thing about it. The plastic PTT switch on the base really squeaks when you depress it. I'm going to take it apart to see if I can eliminate this noise. It is so loud that
I'm afraid it would come over the air (through the mic) when keyed. Anyway else notice this with their MC-50's?

I have an Astatic D-104 from my "CB days" 20 years back and its PTT (side mounted) switch is all metal and very quiet. I may wind up using that mic with the TS-530S.
73's,

Mike
KA4JGP

I mis-stated something:

"You'll need a balanced input on your tuner or a balun to get it back to 50 ohm unbalanced."

Change that to ...to get back to unbalanced. The goal of the ladder line fed doublet is not to present 50 ohms but to reduce the SWR losses with the use of open wire line. The actual impedance presented to the tuner doesn't make much difference as long as the tuner can handle it. There are online references that can explain this a lot better than I can.

I realize I am probably joining in this a bit late but I noticed one thing - you said you connected the radio and the tuner to the ground stake- what is the electric feeding your house grounded to? My reason for asking is over the years I have to come to find that all grounds are not equal - example: when I first moved into my house I had 2 choices on where to hook the ground, the water pipe coming in off the "street" or an old well pipe sticking out of my basement floor. The A/C feed was grounded to the water pipe off the street but for reasons I no longer remember I hooked the reaio to the well pipe. Among other problems I managed to raise a nice blister on one on my fingers when I touched something while I was keying. My neighbor, K2TV, who was working for CBS-TV - senior video engineer - very patiently reviewed with me the subject of proper grounding and how everything must be bonded to the same ground. In my many years working for the phone company, that fact has help solve some rather interesting problems, both in data, voice and video, everything must be bonded to the same ground.
On the subject of antennas themselves, my first antenna was a piece of wire, about 135' long, strung through trees, no more than 15' off the ground and I used an LC network to "tune" it, end fed style. The coil was tapped and I used it for 80 and 40, I didn't know if it would work on anything else but work it did. In this group you have access to a lot of sources, at the time I first became active I kept getting referred to the ARRL books, I learned a lot from them, now it is interesting to see so many people willing to help.

Hmm. Didn't think the TS-520 had a preselector knob; though I do have one on my older TS-599. A preselector is a circuit that tunes a receiver's signal amplifying circuitry for maximum sensitivity on a desired frequency range.

Cause there is no preselector in the TS-520. If you really mean adjusting the "drive" control for maximum receiver sensitivity, all that it is doing is tuning the antenna and mixer coils.

I too have a problem w/the MC-50, the LOCK option doesn't stay in the locked position. I took it apart to see what was obvious, but didn't find anything. If I take the pressure of the PTT key off of the lock, the lock stays in place. Otherwise, it pops right out when I try to lock it.

It's my backup mic, so it's not a big problem, but any ideas?

7166. 6146w max plate voltage ... Exceeded in Kenwood Hybrids ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-03 05:55:23 UTC
From: ke9zm
Topic: 7166 Message: 7166

Was talking to an "old timer" who had a lot of radios. He owned a few Kenwood Hybrids in the 1980's.

Told me that Kenwood exceeds the Max Plate voltage for a 6146x tube.

I checked some tube data and sure enough the max plate voltage is about 750V depending on application.

http://www.nj7p.org/Tube1.php?tube=6146w

My meter on all three of my kenwoods read HV 800+ volts. If this is the voltage on the plate then that's +50v over max for the tube. If this is not what is on the plate then what is this HV reading and how much would be on the plate?

Hi Frank. Like Kevin, I've been reading along, and I don't think you should spend too much effort trying to modify this antenna. I am a pretty new ham, got licensed about a year ago, and I have gone through nearly the exact same antenna excersize that you are going through right now. I don't have any trees, I don't have much space on my lot, and my house is single story providing maybe at the highest point 20' of elevation (at my chimney). I spent a lot of time manipulating and analyzing a wire antenna that runs from the fence, up to the chimney, and back down to the fence. I've analyzed coax and twinlead, but the feedpoint is only about 60 feet from the radio. After spending a lot of time experimenting and thinking about this antenna, I've determined that it is a good radiator for 40m high angle radiation, and that is a good thing. Various tweaks and adjustments have not yielded noticeable improvement on the air.

Your low, 68' dipole is a good antenna for short range, NVIS contacts on 40m. It is a half wave on 40m, more or less, and you can use your tuner to make it match your rig. You should have a pretty low SWR, but don't get too excited about it -- because -- with only 50 feet of coax, your actual losses are not going to be extraordinary. It is true that on some bands the antenna will have high impedance. On 20m your antenna is close to 1 wavelength, so it will probably be showing your coax a very high SWR, and yes, your coax will be operating in a lossy condition. But you still only have 50 feet of coax, so the attenuation of your signal isn't going to be that big of a deal compared to the propagation situation. If you can conveniently switch your feedline to balanced twinlead, the antenna will be as good as it is going to be for a low to ground radiator. You could really optimize this antenna for other bands, making it a really efficient radiator with minimal losses on 20m or 15m. But since it is low to the ground, it is still going to be a high angle radiator, so would still only make short range contacts, and only when the higher band propagation is "in." I think that this propagation issue is going to be more important to your operating enjoyment than the antenna efficiency.

A low 40m low dipole, with high angle radiation, is a good antenna for making contacts, because 40m propagation is good for high angle paths quite often. All day most days, and much of the night many days of the year. High angle paths on 40m will yield surprising DX contacts at night in the dead of winter when the band is very quiet. Contrarily, a 20m or 15m high angle radiation antenna is much more frustrating to use because there are fewer hours of the day, and fewer days of the year, when propagation supports a contact. Operating a low dipole on 40m will be much more enjoyable than trying to make contacts on a low 20m dipole. So I'd leave it alone, or if it is convenient just replace the coax with

twinlead -- then move on to a different antenna experiment! If you can't get a 40m dipole up 60 feet to make it into a "good" antenna, perhaps you can figure out how to get a 20m dipole up 30 feet to make a "good" antenna. (That is what I'm working on now).

> <more stuff snipped>

... if you do enjoy calculating all this, and can model or measure the SWR
on various bands, it's easy to calculate feedline loss with some of the
online calculators. Enter the coax type and conditions and they'll tell
you how much power you're losing. This is one I use:

http://www.ocarc.ca/coax.htm

While the power lost can sometimes seem large, remember how it all works
with db and if the other station can actually hear the difference or not.
It can help determine if switching feedlines is worth the effort.

Hope this helps,

- Dave

OK

Let me try again, 7.173 is Digital SSVideo

http://www.baldeaglejournal.com/digSSV.htm

What do you think of Digital SSVideo -- now heard daily on 14.233 KHz, 7.228 KHz and 7.173 KHz? Digital is a different ballgame and a bit more complex to understand. Whereas Analogue SSTV sends information a line at a time (like Facsimile) and color information is sent sequentially, the Digital system sends blocks or segments of information.....

7176. Whats with these RF Parts guys .... Upselling via technical spin? GE 6146W

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-03 22:14:12 UTC
From: ke9zm
Topic: 7176 Message: 7176

Last week I ordered a couple of GE 6146W tubes from RF Parts.. On the phone the sales guy said that brand (GE) "not recommended" for Kenwood Hybrids.

The sales guy tried to upsell me on on the Sylvania 6146W and told me that those were recommended for the Kenwood...

The GE 6 146W are $40/pair
The Syl 6146W are $60/pair
or ... 50% more $$

So, based on my research and info here on this newsgroup I bought the 2 x GE 6146W.

They arrived today and I even got it in writing on the Invoice..

"CUSTOMER WAS ADVISED THE ABOVE TUBES NOT RECOMMENDED FOR USE IN KENWOOD RADIOS"

So, what is going on here? Has RF Parts technical folks surrendered to the marketing folks spinng their technical advice just to upsell you on a brand tube that cost 50% more when you don't need it? If so, thats too bad... If they are "not recommended" then why not? The sales guy cited only "experince" but no technical reason.

On top of that, one of the tubes JAN 6146W arrived with the glass envelope loose from the base.

So, what's the straight dope... ?

Hi everyone. The name is Geoff and this is my first message to the group, though I've been enjoying the contributions and discussions over the last couple of months. The level and maturity of advice and discussion in this group is most impressive - perhaps a reflection of the types of folk that buy and treasure old Kenwoods.

To business. I have a 530S with reduced (50%) power out and low HV = about 450 volts with heaters running. The problem (a common one, I believe)is a shorted filter capacitor C22/C24. I have sourced a local supplier in Sydney Australia - RS Components - who have 120uf, 500v caps at A$17.40 each. Physical compatibility is yet to be confirmed, but looks OK from the website description.

Could anyone advise whether there is anything to be wary of in selecting a replacement apart from the obvious: voltage rating etc. Also, are there any Aussies who may be aware of other possible replacements for these components available locally? Thanks and regards to everyone, Geoff Hegarty.

Ummm, if you don't mind a hand mic, try Ken's Electronics. He sells high impedance mics (both hand, and I think desk) for the Kenwood hybrids. Here's the URL for his mic webpage:

http://www.kenselectronics.com/lists/mics.htm#Amateur

Remember, nominal impedance for the TS-520s (and 820S) is 50k ohms.

7182. 6146w max plate voltage ... Exceeded in Kenwood Hybrids ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-04 04:56:14 UTC
From: Bruce Wright
Topic: 7166 Message: 7182

Dear Fellow Group Members...

While it's true that the HV is above max for this tube, 6146B's have demonstrated the ability to run at near 1000 volts as long as the total plate dissipation is not exceeded in accordance with intended service and duty cycle demands...Indeed, the 1966 ARRL Handbook has a construction article for a grid driven, bandswitching amplifier for 80 thru 10 meters with 2 parallel 6146B's running with 1kv on the plates.

However, having said that, I prefer to stay within the operating voltage, current and plate dissipation ratings as recommended by the tube manufacturer...Tubes, such as the 6146/A/B/W are not getting any cheaper.

FWIW

Bruce
WC5CW

Was talking to an "old timer" who had a lot of radios. He owned a few Kenwood Hybrids in the 1980's.

Told me that Kenwood exceeds the Max Plate voltage for a 6146x tube.

I checked some tube data and sure enough the max plate voltage is about 750V depending on application.

http://www.nj7p.org/Tube1.php?tube=6146w

My meter on all three of my kenwoods read HV 800+ volts. If this is the voltage on the plate then that's +50v over max for the tube. If this is not what is on the plate then what is this HV reading and how much would be on the plate?

From: ke9zm
Topic: 7183 Message: 7183

I saw Ellens posting about Desk Mics and for those of you new to the Hybrids and buy a MC-50 without the Manual... be aware that this is a dual impedance mic and its not at all obvious how to change from High to Low Z. At least when I got mine, it was a mystery without the manual.

The MC-50 has a barrel with red and black dots and depending on how you attach one of the cords its going to have a different impedance.

Low Z is 600 Ohms for Moden rigs
High Z is 50,000 Ohms for Kenwood Hybrids.

The 520 and 820 want the High Z
The manual for the 830 says it will work with both - but I use Hi Z on all of my Hybrids

If you dont have a MC-50 Manual - take it from here.
http://frrl.dyndns.org/frrlnetannex/ClassicRadios_Manuals/

Take it, I am not promising to maintain this site.

Seems to me the impedance range for the audio input
(mic) was about 500 Ohms to 50k Ohms. So anything
in that range should work...some better than others. You
may have to try several to get the best audio. I know on my
former 520s the mics that gave the best audio were about
600 Ohms. They work just as well on my 830s and my 700sp.

Heck even an old Radioshack replacement CB mic works well
and has gotten good audio reports although not as good as the Astatic.

7186. Help!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-04 15:28:35 UTC
From: Ellen R
Topic: 7186 Message: 7186

My recently acquired TS-820 is giving me problems. From the get-go, I could get drive out of the 12BY7A, but have had problems with the finals. Up until last night, I could at least set biase/plate idle current on the 6146Bs, but could not get plate current (much less dip it on tune-up), or RF output. That all changed last night, when I put in a new set of tubes. I bought them on Saturday, from AES in Milwaukee (I only live 10-12 miles from the place), hoping that maybe the problem, was just a burned out set of finals, only to find out when I opened the boxes last night, that they're Chinese 6146Bs. Of course we all know how nasty those can be. Ugh!

Figuring nothing ventured, nothing gained, I installed these "tubes" (and I use that word loosely to describe them). Well they flashed over, and blew. But, in the process they caused even more problems. Whereas before I could at least get, and/or set plate idle current before, I can't even do that. My idle current is ZERO. Even (what I assume is) plate high voltage is zero. This is true, even with the Phillips tubes that came with the rig. It looks like I have some troubleshooting ahead of me. A friend of mine who lives several hundred miles away from me, and used to be an RF tech. (before worsening eyesight [coused by glaucoma] forced her to quit doing that type of work), suggested a good starting point, would be to check pin voltages on the finals. The problem is, that I don't have a service manual, so I don't know what these voltages are supposed to be. Would anybody know? Also, what are the group's suggestions as to how I should troubleshoot/attack my problems? Any information would be appreciated.

73 & thanks
Ellen - AF9J

Topic: 7183 Message: 7187

Ummmm, actually I did not post about desk mics. But I did reply to
the query for a desk mic, stating that there was a place that has a
supply of hand mics (and possibly desk mics) for Kenwood hybrids,
that will match their high impedance of 50,000 ohms. If you don't
decently match impedance, not only will you have low audio input, but
you audio usually sounds lousy (as in pretty tinny).

I have posted the service manual for the TS-820(S). Methinks the (S)
indicates 820 OR 820S. It was at RUBE and mods.dk. I found a free
and easy file hosting site, so I posted it there. Let me know if
anyone can't get to it and I'll try something else.

Thanks again Frank,

I found what I thought was a source for a service manual, during a break at work, but it was in a goofy zip format (I had to download a german freeware program to unzip it), and for some reason it had multiple parts to the manual. I only got the first (of supposedly 8 parts) to unzip. All of the other parts seemed to be corrupted files. Here is the URL I used:

http://www.eserviceinfo.com/downloadsm/6808/kenwood_TS-820S.html

I bought my TS-820 (non-gigital display version) from Associated Radio. It was suppesed to be in working order. Considering how much of a hassle it will be to send a 40lb. radio back to them, I would just as soon try to get it going myself.

Thanks again & 73,
Ellen - AF9J

Yup, just became aware of the wet fence issue today! Your feedback
doubles that. I was told to get some wire standoffs, but I can't seem
to find what I need. If anyone has a link, plz post it.

Thanks Brent!

7195. My TS-520SE alignment experience. :)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-05 04:34:29 UTC
From: dslund817
Topic: 7195 Message: 7195

Well - I took the plunge this evening and aligned my radio - at least I think I did. :)

Ended up having some issues. First thing I discovered two cracked slugs the 160M mix and ant slugs. My guess is that since these are the first two slugs in the procedure - the last guy used the wrong tool. ?? Anyways - doesn't seem to be any good way to turn a broken slug so I left them the way that they were and went on with the procedure. Had to read the instructions several times to figure the stuff out, but things seems to peak where they should. In the mixer section everything peaked just a little bit better.

The frequency dial is off a little bit and the instructions said to adjust TC1 in the vfo section - can't find that - so I guessed - the hole in the top of the vfo case? Well that adjustment would adjust the frequency - but not far enough to get the dial calibrated. ??

The other thing that I could not locate was the noise blanker board.

Have no 50db signal source for adjusting the S-Meter - so guess again - tuned up on the calibrator and set the meter to about +20 on the meter - now the meter moves - is there another way to set it right?

Overall I think it went well since at least the drive setting is the peak ALC and peak receiver so I can now use 20 meters.

Any idea where to get replacement coil slugs to replace the broken ones or does it really matter if they are broken - I don't use 160M anyways.

I learned a lot from doing this and I think I managed to not destroy the radio. :)

David

G'day david

I just had a similar experience here in Sydney with an old TS520, the ferrite tuning "slugs" are fairly hard to get as far as I know.

I ended up using some slugs out of an old colour Television Tuning board, and yes they worked and yes, even the thread was the same.

The Television was a sony, about a 1980 vintage,

have a look at an old TV, you may be suprised!

Hope this helps!

Ellen:

TS-820
Go to page 32 of your operating manual. On the final board find R-2 and R-3. These are 10 ohm at 1 watt. Replace them with 10 ohm 1 watt resistors. Do not use larger wattage resistors as they double as a meter shunt and a fuse.

On the same board replace R-5 and R-6. These are 100 ohm 1/2 watt resistors. This should resolve the problems caused by the flash over. Do not reinstall the new tubes.

The following is worth checking and may help resolve some of your power issues.

You will next need to locate a board labeled HV unit. This is a small board on the bottom of the rig near the rectifier board. It is not pictured in your owners manual but is shown in the main schematic on Page 43.

Locate R-5 and R-6 on this board . There are 5.6K at 1/2 watt. Replace them. Find R-7. It is a 12K 1/2 watt resistor. Replace it.

If R-7 has been replaced with a resistor of a different value or jumpered with another resistor or wire, remove these modifications and restore it to the original value of 12K 1/2 watt.

Most of these parts can be located at Radio Shack in the drawers in the back or at Fry's electronics. They also should be available at other parts suppliers as they are common parts. The 12 K resistor may be more difficult to find. If you have a good ohm meter, you can measure it and reinstall it if it looks and measures good. The other resistors can be checked and reused but in view of their age, I would recommend replacement. To measure them you will have to unsolder at least one end from the board.

After doing this, be sure that you SG switch is on and that the Carrier control is fully up. Let us know how it does and what the power is. Power should be measured into a dummy load or a antenna with a very good SWR on every frequency that you measure the power.

We have a sister Yahoo group site called KenwoodMics.

The MC-50 manual is posted there.

I would suggest that everybody on this group also sign up for the
KenwoodMics
group.
It is a very low traffic group.
If you are worried about too much e-mail, click on the "no email"
preference when joining. You will not receive the posts automatically but
will have access to the group when you wish.
Of course, you are invited to receive the e-mails if you wish.

This site has information about the MC-50, the production error that causes
MC-60s to have so many problems, and information about D-104s among other
helpful information. Check the files section.

KenwoodMics http://groups.yahoo.com/group/KenwoodMics/

7200. TS830S-main rig fuse blew

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-05 17:06:04 UTC
From: stevehurstg8lik2003
Topic: 7200 Message: 7200

Another rig from eBay which arrived today in very good condition and apparently all OK at first. After tune up and 20 seconds into calling CQ on 20 metres the rig went dead and the 4A rear fuse blew with a bit of a smell of overheating. Checked the internals including the final board especially the cathode resistors (the schematic shows these as being 20 ohms rather than 10 ohms in earlier rigs) and nothing untoward seen.If these had been stressed they did not show it and I had no spares anyway to replace them with.
Fitted a new pair of GE6146B as this being a prime cause for concern after reading you guys most helpful articles,and touch wood all seems OK for the moment though time will tell. The finals removed were the Japanese ones that had been in since day 1 so I guess the shipping finished them off though they measure OK cold with a multimeter.
Best regards to all, Steve G8LIK

Did you properly tune your rig before transmitting ?
This fuse blow happens also if you have a high swr !

Topic: 7205 Message: 7205

Hello all! I have too many radios, never thouhgt I would say that. I have added a TS850 to my operating desk, and the TS-520 needs to go. I hate to sell it, but if it sets in a box in the garage for a long time between uses, well you know. I have the DG-5, TS-520 speaker. I have pix if anyone is interested. The only thing I am unsure of is the 10 meter band. It works fine on the 28 to 28.5 section, but the top two 10 meter sections displays the 3.75 mhz freq, like the crystals are n ot working. I will look at it, and see if it's a easy fix. I have the operating manual, and the service manual.

Hi Patrick, yes it was not operator error for sure (I had a TS530SP since 1984 so know the ropes on tuneup). I think if you send any rig even well packed in its original box by 'parcelforce' aka the British Post Office mailing service for heavy/bulky items its going to have some shakes along the way and those original Japanese finals dating back to the early 80s with fragile filaments/grids after lots of use are at risk. Anyway no more problems since fitting the new GE6146B but still crossing fingers.

It is the size just below the big one itaht comes with the radio shack kit. I'm not sure where I got mine - I got a set back in high school for work on TVs. You might check here:

http://www.minute-man.com/acatalog/TV_and_Radio_Alignment_Tools.html

The have a big variety of sizes.

Is there any other problems from having this switch in the wrong position or using a mic with the wrong impedence? Is there any possibility of damage to your rig or mic?

Tnx

I bought my MC-50 and did not have the manual. I hooked it up to my hyrids and it just didn't work. I thought it was broken but I knew it was dual Z and Kenwood needed high Z. HB9DDS, Daniel was nice enough to send me the manual. It is NOT at all obvious, without the manual, how to change the Z. After reading the manual, I changed the Z and all is well.

I'm no electroics guy, but from HS and college electronic I remember that the max power transfer happens when impedences match between 2 circuits.

From the Kenwood TS-520 manual "The microphone input is designed for high impedance (50K ohms) microphones only."

So, if you have 50K then use it. Low Z mics may work but the max power transfer from the Mic to the radio will be diminished. I have a 830 and that supposedly works 600-50K. I use 50K

The MC-50 works great with the Kenwoods and delivers far more power than is needed to peak the ALC on transmit with only moderate Mic gain and compressor off. My experience.

Hi Chris,

Unless you really have an extreme case of audio distortion (distortion is always hard on components - take this from a metal head guitarist, who has played distorted guitar in rock bands) from having to crank the mic gain to the max , and then shout into the mic to get enough modulation (a pretty rare set of conditions), it really shouldn't hurt the rig. It just gives you two negatives you have to deal with:

1. Low audio drive to the mic amplifier (and hence low modulation).
2. Lousy sounding audio (it's usually pretty thin sounding).

Ellen - AF9J

P.S. - my mic from Ken's Electronics arrived today. I'm still kind of burned out from having a cold or flu for the past week. I'll try to work on the TS-820 tonight, but I can tell I'm starting to fade. I have a feeling, I'm going to have another marathon sleep session tonight. Well, suuper is ready.

I found something of an answer to this question on my own, but in case
anyone else was interested:

http://www.icycolors.com/nu9n/scope_your_audio.html

Looks like one needs a rf demodulator and rf sampler.

Any other ideas?

Looking for someone that owns a TS-520s in the S. Fla area. I have a DG-5 that I just had fixed that still isn't working. I need to determine if there is a TS-520s problem or a DG-5 problem. If you have one in the area, please let me know!!!!

Thanks!!!!

From: Ellen R
Topic: 7219 Message: 7219

Hi Everybody,

I finished working on my TS-820 a couple of hours ago, and it's working again. I'd like to thank everybody, who offered me help with obtaining a service manual for the radio (I used it to double check the areas I was working in). I would especially like to thank Walt, N9WB for his suggestions to check certain key resistors on the finals, and high voltage boards. That did the trick.

In a nutshell - R2 & R3 - were within spec on the finals board, but as long as I had them off the board, I replaced them anyway with newer ones (besides, the ones I bought were better - they were metal film resistors, instead of carbon comps). R5 on the finals board was also OK, but R6 was out of tolerance (it was 115 ohms, and was supposed to be no more than 105 ohms). I replaced not only R6, but R5 (since I had a new one on hand).

On the high voltage board, R5 & R6 (both 5.6K ohm), and R7 (12K ohm) were shot. Two of them (R5 & R7) actually fell apart as I was desoldering them from the board. Of course all 3 of these resistors were replaced.

I buttoned up the rig, powered it up, and tested it. I was able to set bias/plate idle current. I was also able to tune the finals (I had plate current, and was also able to dip it), and had RF output. I can't wait to try it out. I also received the mic I ordered for it, in the mail on Friday. Once again, thanks people.

73,
Ellen - AF9J

Thanks. :)

Next on the agenda is to add the WARC Bands to it (many thanks to Frank, K2NCC for providing access to the WARC Mods article). I'm not sure if I'll add 30m (my Small Wonder Labs DSW-II I'm waiting for is going to be for 30m, and my IC-703 plus is going to be my 30m digital radio). But, I wouldn't mind 17 & 12m.

I haven't done much 17, but what little I've done, I've liked. I've also heard a lot of good things about this band. The last time I really did much 12m, was in college (when I cut the jumper on the club's TS-830S to enable operation on this band). I enjoyed operating on it then (had some really enjoyable ragchews, eventhough I'm more of a contester than a ragchewer), and I'd like to get on it again, because it is such an overlooked, and underused band. The thing that's nice about the WARC bands, is that they seem to be a bit friendlier operatorwise, and operatingwise than the traditional HF bands.

73,
Ellen - AF9J

I am restoring this transeiver and would like help on the following To confirm i have fitted new 6146 and replaced the cathode /screen and screen divider resistors for tune position. All now ok 100watt out . However the Tuneposition is not working correctly . following instructions the IA is set at 60ma on ssb but when returning to tune thereis virtualy zero current . consequently i am unable to DIP on this safe setting .the screen voltage is halved on tune as measured.Consequently i tuned on max power quickly!

ALC Following the instruction manual on tune the drive does not peak the ALC reading Nb I am able by readjustment off bias pot to have reading on tune but on returning to ssb stannding current is 150ma. all voltoges appear ok

The Notch knob control is seized it will not move is this a dual pot?

The display is now working on all bands after clearing a bad pin/skt on pcb . But one segment is out on all figures so 0 looks 9 any thoughts on this one Views and ideas Please BOB G8ACQ

Topic: 7227 Message: 7228

Bob,

I have a couple of 530s, which as I am sure you know is the slightly down market version of the 830, so I will assume that much of what applies to the 530 also applies to the 830.

The screen grid voltage is reduced in the TUNE position the standing anode current is zero, or very close to zero. On the 530, in TUNE, I can drive the plate current up to about 100mA. With an anode voltage of, say 850V, this gives a dissipation of 85W. The plate dissipation for the 6146B in ICAS operation is 35W, so assuming that the power is shared equally, the dissipation is just a bit above the rating of the tubes, so it is a fairly safe way of tuning up. If you have a problem dipping, then you could switch the meter to the RF voltage position and peak that. My (uncalibrated) AT-230 ATU shows about 12W maximum output in the TUNE position.

When tuning up, I select TUNE and peak the ALC reading using the DRIVE control. I then peak the output whilst looking at the meter on the AT-230 and then adjust the ATU for zero reflected power. I then switch to CW and quickly peak the output of the 530 - I find the 530 PI-output settings are not quite the optimum if set in the TUNE position. I do not monitor the plate current at any time.

I can understand the attractions of modern transceivers with auto-ATUs! Less fun though......

The display is multiplexed and if you have one segment out on all digits then this may well be a counter/driver fault although it could still be a display fault. Do you have a scope available? The 530/830 use an LSI counter chip (TC5070P and the data sheet can be found at www.alldatasheet.co.kr/), unlike the 820 that uses 74-series logic. This chip does the counting, storage and multiplexing and drives two level shifting ICs.

Hi I am new to the list..

I am working on my General ticket & purchased a ts-530s.

My Dg5 is screwing up & I lose 1 quadrant of the display, also I think
the last digit..
I am fairly good with 12 V electrics but this is surely beyond me.
Any advise on getting it repaired or fixing it myself......
The Quadrants will come on eventually but not the last digit...

Also I have just been given a cushcraft AV5.
1 of the (coils ??) looks smoked..
Would anyone know is this from Lightning or could it of failed because
of power...

Is it repairable? or shall I make it a huge Scanner Antenna??

Thanks in advance..

Do you mean that you are losing a segment common to all digits - I'm not sure what you mean by "quadrant"? The display is multiplexed and so a bad joint/contact between the segment driver and the display could give this result. Which segment is missing?

A second bad joint/contact on the digit driver might also explain the missing digit (I assume you mean the right-hand most digit)

You mention you have a TS-530S. Do you mean the TS-520S? The DG-5 display is an external display for the TS-520.

If this is the voice peaks when you are talking into the mike, this is normal. You are still putting the full peak power, but your meter cannot begin to move fast enough to follow your voice peaks. With your meter switch in ALC do you get deflection to the end of the ALC mark on the ALC scale when you speak some of the time? (not full meter scale). If you give a long steady whistle into the mike, it will probably read higher.

I'm betting that everything is OK.

Have you measured the screen grid voltage while on tune? A failure of R 15
on the rectifier board usually causes the Tune position not to work, but
when this happens, you have no screen voltage in Tune.

7234. TS-820 Service Manual

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-12 14:20:10 UTC
From: Hauser, Ron M.
Topic: 7234 Message: 7234

Ok, I have the pdf file of the TS-820 service manual that is on a few different sites. File name is TS-820S_Service_manual.pdf, I got one copy off of HAMFTP, and another off the mods.dk site. I can read it ok on my computer using the pdf reader, but when I try to print it, there seems to be a problem. It seems to print one page at a time, very very slowly, and I'm wondering if anyone else has had any problems with printing this PDF. When I look at it on the computer using the pdf reader, I see that some pages are of a different size. I wonder if the pdf is corrupted in some way. Additionally, does anyone have a different copy of this manual in a cleaner file?

Thanks!

Walt, When I am talking normal it is peaking right at the top of the ALC scale.I went thru the tunng procedures in the manual and I am getting all the right responses. It must be doing OK. Thanks for the help Dennis N8YK

--Walt I can confirm that screen voltage is correct and reduces to 130volts on tune . I had originally to replace the r in btm end off divider as screen volts were high on both settings . Today investigating further i find that c w acts just the same as tune other than screen volts rise but standing current very low athough set at 60ma on
ssb
So when i key on cw i get no output yet ssb shows 60ma standing current and talks up to 100 watts It looks as if i have a fault common to tune and cw.? I repeat from my first post that peak only works on receive and does not affect alc display reading which is three quarter scale does this ring any bells thanks for repland any further ideas BOB

Hi Richard::

Yes the lower right (segment) on all digits goes on & off depending on
if its cold or not..

The last digit comes on weak sometimes...(rarely)

& yes I did mean TS 520S..

& yes the Dg5 is the Freq counter for it..

I should of been more clear..

Thanks for the reply...

Richard thanks for your reply First new infomation. Today I
wired a key and found that on CW I get low ie not the 60ma i set
standing current and this does NOT increase when I key so it appears
that tune /cw may have common fault. ssb talks up to 100w ok .
when you say you can drive in tune position what are you driving
with Carrier? As my original post my ALC does not alter or peak
using peak control this works fine on
rx
Yes I have a scope but I am not sure what to expect is there a test
i can do to prove if it is the display itself. please see my other
reply to Walt Regards thanks for your time BOB

The next thing is to be SURE that the carrier control is fully up. This is behind the Mike gain control.

Next, if a key is installed in the CW jack it must be closed to get output on tune and CW.

After checking the above, please note that there is a set of contacts in the CW jack that closes when no plug is inserted into the CW Jack. Get a mono phone plug to fit the CW jack. short the tip and ring contacts. Plug it into the CW jack. Do you get any carrier now ?

I am not very familiar with the 830 (M) version. Does it have AM ? If so, do you get any carrier output on AM ?

Richard:

How would I find out where on the board that exactly is..

I have had it apart & didn't really see anything that looked like a cold
solder..

It is the bottom right segment that goes out on ALL digits..

Thanks..

This is normal to see on on a physical analog meter. To see the full
power you might try whistling into the mic at a steady pitch. At about
1000Hz you should see a steady power out of maybe 85-100 watts.

On my Yaesu FT-847 with a fast LCD display I can see voice peaks at
100W but my analog meter on my tuner only shows about 25-30W

Gary / ke9zm

Bob,

Walt is doing his usual fine job around the PAs, so I'll concentrate on the display. I assume that you have a copy of the 830 Service Manual - if not I can e-mail a copy to you.

From your first e-mail, I assume that it is the bottom left segment that is no being illuminated. This is the "E" segment by convention. The counter/store/decoder is Q5 and hopefully this is OK. For this IC to drive the display, two level shifters are required, Q10 for the segments and Q11 for the digits. Q10 is a TC5066BP - I don't know what that is, but its output drivers may be as simple as an array of PNP transistors - and the outputs that feed the segments of the display are pulled down to the negative voltage of the display by a resistor array RB-2. The inputs to Q10, from Q5, are pulled down to 0V by another resistor array RB-1.

So I suggest you check out Q5 pin 9 to Q10 pin 5 and Q10 pin 11 to the display, verify at the same time that the appropriate resistors in the resistor arrays (4k7) don't have dry joints or are open circuited.

If you want to discuss this over the weekend give me a call on 07808 935630.

Richard G3OTK

Topic: 7229 Message: 7244

Hi Gno,

Sounds like a joint/contact problem or two. The lower right segment is the "C" segment by convention.

The display is multiplexed, that is one digit at a time is illuminated and the sequence of digits is run through sufficiently fast that it looks continuous. Therefore there are two drivers connected to the display, one that drives segments (LED cathodes) and one that drives digits (commoned LED anodes). It seems you may have problems with both.

Incidentally, I had assumed that the DG5 used the same circuitry as the display in the TS820. Fortunately I took a look at the DG-5 information that I have and found that it doesn't, so that's an embarrassment avoided! Do you have a copy of the schematics of the DG-5? If not drop me an e-mail.

The segment decoder is IC39, a SN74247, (try www.alldatasheet.com/datasheet-pdf/pdf/TI/SN74247.html if you want a copy of the data sheet) and segment "C" is driven from pin 11. The current to the "C" segment of the LED is fixed by R105 (56 ohms) and this goes to pin 8 of each of the three dual LED digits, D1 to D3. So I suggest checking out this path. If you don't have a 'scope to check for activity on these pins, then I suggest a good visual inspect/re-soldering of the pins.

Now to the digit driver. The right-hand digit (D3) has all of the anodes of the segments connected to pin 13 and this is driven by Q25 (a PNP 2SA562) This is "on" for one-sixth of the time. Q25 is driven from IC41 pin 4 via R112 (470 ohms) - IC41 decodes the digit counter IC40 so that one LED at a time is driven. So I suggest you check the path IC41 pin 4 to D3 pin 13.

Good luck!. I will be QRT on e-mail from 17:00 UTC today until Tuesday. Let me know how you get on..

73s,

Richard G3OTK

Gno,

I will e-mail the schematics/layout of the DG-5 to you.

7247. TS-520 meter pegs right in receive

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-14 00:20:50 UTC
From: james27613
Topic: 7247 Message: 7247

hi,

My turn to ask a question for a change !

picked up a very clean ts-520,
with unknown history.

No obvious signs of abuse or modifications,
insides are pristine !

During initial testing

when powered on, (few seconds only !)

the meter pegs full scale and will
remain there, no change if any
switches or controls are used.

AF RF gain controls at minimum,
no speaker output,
with af rf max speaker output very weak

Meter functions in xmt (dummy load)
tune setting to verify hv is ok.

I appreciate any tips for troubleshooting.

There was a mod which may be the one on rube, which is not for the faint of heart, nor for the non-techie at all that was published in QST, and there are some power trades to be made to accomplish it. There were also flaws in the QST article that were corrected in a follow up article on some of the wiring, by someone who did a web publish on it, some time after the QST article. It can be done, just move with extreme caution.

Turn the RF gain all the way clock wise.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-14 03:50:59 UTC
From: Ellen R
Topic: 7099 Message: 7252

Over the last week or so (especially since I fixed the problem I had with my finals, this last Sunday), modifying my 820 for the WARC bands has become a pretty low priority. Besides, if I want to operate on the WARC bands, I have an IC-703 Plus I can use for doing that.

At the present time, I'm happy with the rig. My only bummer, is being stuck with the set of Chinese 6146Bs I bought 2 weeks ago, that flashed over on me when I powered them up. They're basically a white elephant to me.

I gave the radio a shakedown QSO on both 40m SSB & CW, with WD5ABC. It works fine (although the transmit freq. on SSB is off of the receive freq. by about 200 Hz - I'll have to realign that). But, the Phillips finals that came with the rig are tired. I couldn't get more than 70W out of them, even into a 300W dummy load.

73,
Ellen - AF9J

Topic: 7122 Message: 7253

I got my mic from Kens last week Friday for my 820. The audio with it seems to be pretty good. BUT, it is a hand mic (actually I prefer hand mics to desk mics, I find them ergonomically friendlier). It cost me about 30 dollars. I will say this, I suspect that it's from an old FT-101, because it has a cutout on it's face where the Yaesu nameplate would go, and looks identical to the mic I used with my FT-101B back in 1986 & 87.

If you're waiting, and have any quesions, do like I did, and e-mailan inquiry off to them: here's the URL for the inquiry (it's sort of a fill in the blanks form):

http://www.kenselectronics.com/about/guestbook.html

They answered me within several hours of my sending an e-mail inquiry, informing me that the mic had been shipped out 2 days ago. I have no complaints about Kens. The mic works well. I also belong to SKCC (Straight Key Century Club). A ham in that club, who owns a TS-520S, gave me the referral to Kens. Just rea;lize that it may be a used mic. Ken states on his website, that he believes in recycling/reusing perfectly serviceable stuff,and that it's stupid to throw the stuff away.

Ellen - AF9J

P.S. - here's the URL for their m 520S & 820S wired mics:

http://www.kenselectronics.com/lists/mics.htm

From: Ellen R
Topic: 7122 Message: 7254

If you insist upon a desk mic, e-mail Kens to see if they have anything desk micwise that will work with the 820.

Also, there are a lot of Astatic D-104 mics out there. Some are high impedance, some are low impedance, and some have a built-in preamp. The high impedance D-104 is usually from the 60s or earlier, and may be a little harder to find. The low impedance D-104 does you no good. But, the D-104 that came with a built-in pre-amp, that was made up until recently, should work OK with the 820 (the pre-amp helps to overcome impedance issues). A friend of mine uses a D-104 with the built-in pre-amp, he got off of e-bay, with his FT-101 (which also requires a high impedance mic), and it works fine for him. He gets good audio reports too.

73,
Ellen - AF9J

Walt I can confirm that i had already done and have redone the key test and whilst i can hear the audio tone in LS there is no drive ie no change in IA confirm drive control at MAX.this is in full CW ie not tune .Both LSB /USB/and AM are good To recap I get no output in TUNE or CW Is there anything common in the drive cct. I ballanced standing current in usb lsb by setting DIP adjustment pot on IF board This is now stable as set at 60ma. Thanks for your input and time BOB

Meter will peg full scale on receive with Rf gain fully down.
Does it still peg with RF gain full up?
If so does it do so with the filaments off?
If not, does it do it with SG switch off but filaments on ?

The impedance of a microphone is not very important. When there is an impedance mismatch, the level will be reduced.

If a low impedance microphone is fed into a high impedance input, the level will be lower than a high impedance microphone because the output voltage will be lower. If there is enough system gain to overcome this, there are some advantages to under-loading, that is loading a microphone with higher than it's output impedance. One of these advantages is that the frequency response will flatten out. intentional under-loading is often done in commercial work.

When a high impedance microphone is terminated by a low impedance it's frequency response will be limited. It will sound low middy or middy, sometimes thin. This is because some of the voltages will be swamped at certain frequencies.

The Astatic d-104 is a very very high impedance element. It sounds middy at 50 k ohms impedance and even worse at 500 ohms. The G8 stand has an amplifier that loads this element at one meg ohm and has an amplifier output impedance that is low. However it has plenty of soup to work well with a 50 k ohm input such as the Yaesu FT-101 or Kenwood TS-520 etc.

The problem with this is that the Astatic amplifier is still not high enough impedance load on the D-104 element even at 500 k ohms to 1 meg ohms so the element sounds too peaky in the mids.

If the amplifier is modified to a one FET amplifier, it will smooth out and sound very good with most rigs. It will sound good with the Kenwood Hybrids such as the TS-520-820-530-830 and the Yaesu FT-101 series and many others.

for more information on this go to http://n9wb.org/

If you want a hand mike Heil sound makes a Handi mike that he can put a HC-5 element into for you. Or you can fit the HC-5 into a existing mike. It will sound good.

Bill K0ZL established a Yahoo Group called KenwoodMics for discussing mikes for Kenwoods. Please join, and we can continue this discussion there.

Hi walt and gord,

some additional information

No key or mic are connected.

rig powered on, immediate meter swing full scale peg right

AF or RF gain controls will not change the meter
peg to extreme right of scale, adjusting will not change
the meter position.

RF gain control full clockwise, af (counter to full clockwise)
very low audio to speaker, meter remains peg full scale right.

heater and sg switch are off, meter will peg full scale right
with heater on + sg off, same problem
with heater on + sg on, same problem

problem is there when in tune/cw/ssb modes

with heater off sg off, tune mode
SEND meter stays full scale peg right
if I move meter switch to HV (get good reading, meter responds)
Meter switch to RF, meter swings to zero (no key or mic in use)

I have the schematics and the op/svc manuals.

thanks !

73 james ke4drn

From: The Bandit
Topic: 7262 Message: 7262

I have a DG-5 that works fine, except with my TS-520S. Works on other TS-520S's. I'm told that my rig isn't putting a high enough CAR signal out to drive the DG-5. Does anyone know how to increase the output on the CAR jack?

Thanks!

How low will we go? Check out Yahoo! Messenger□s low PC-to-Phone call rates.

Subject: Re: [TS-520_820_530_830] Re: Desk Mics

The impedance of a microphone is not very important. When there is an impedance mismatch, the level will be reduced.

If a low impedance microphone is fed into a high impedance input, the level will be lower than a high impedance microphone because the output voltage will be lower. If there is enough system gain to overcome this, there are some advantages to under-loading, that is loading a microphone with higher than it's output impedance. One of these advantages is that the frequency response will flatten out. intentional under-loading is often done in commercial work.

When a high impedance microphone is terminated by a low impedance it's frequency response will be limited. It will sound low middy or middy, sometimes thin. This is because some of the voltages will be swamped at certain frequencies.

The Astatic d-104 is a very very high impedance element. It sounds middy at 50 k ohms impedance and even worse at 500 ohms. The G8 stand has an amplifier that loads this element at one meg ohm and has an amplifier output impedance that is low. However it has plenty of soup to work well with a 50 k ohm input such as the Yaesu FT-101 or Kenwood TS-520 etc.

The problem with this is that the Astatic amplifier is still not high enough impedance load on the D-104 element even at 500 k ohms to 1 meg ohms so the element sounds too peaky in the mids.

If the amplifier is modified to a one FET amplifier, it will smooth out and sound very good with most rigs. It will sound good with the Kenwood Hybrids such as the TS-520-820-530-830 and the Yaesu FT-101 series and many others.

for more information on this go to http://n9wb.org/

If you want a hand mike Heil sound makes a Handi mike that he can put a HC-5 element into for you. Or you can fit the HC-5 into a existing mike. It will sound good.

Bill K0ZL established a Yahoo Group called KenwoodMics for discussing mikes for Kenwoods. Please join, and we can continue this discussion there.

Here's the URL of the webpage that sells the mic I bought from Ken's Electronics: http://www.kenselectronics.com/lists/mics.htm

You can find it's description 1/3 of the way down the page. Here's how they describe it:

MIC-TS520 Custom 50K ohm Dynamic hand mic TS520S & TS820S, CBC4 plug $28.98

As you can see, it's listyed as being for the TS-520S & 820S. Mine arrived a week ago from Friday. It was wired with both the plug, and the cable (although I wish the cable was a little longer). I've only used it once (this last Wednesday, when I was giving the 820 a shakedown QSO on 4om CW & SSB, to make sure it was working OK, after I repaired it last Sunday), and I got a decent audio report with it.

The guy from the SKCC group who referred me to Ken's (Bob Baxter, AA7EQ), says that his works great with his rig. I'll try to get in some more SSB time with the rig, so I can provide some more data on the mic's performance.

73,
Ellen - AF9J

16/04 Walt Iam stuck and going round in circles . As you are possiably aware the Drive control [been the outer knob] is in fact the front set off tags on a 4 bank unit and it is impossiable to get to the contacts due to the front angle on the cover . Unfortunatly due to poor copies off circuits I am unable to actually find the drive control shown on circuit so that I can actually check its input/out . I can with key s/c on CW just see output and carrier pot at top JUST alters this so I am concluding that pot is ok but unsure where to start now as again the voltages marked on cct are not clear Do you think it may be that the filter selector diodes may be a problem .I should add that the M ie AM model has AM And SSB hf filters as standard plus the 450 kc/s filters . CW 4 link is selected but tried all no differance . Sorry to be a problem would value any advice Thanks BOB G8ACQ NB it appears the IF board has differant part code for M series ?
filters.

Hello I'm looking to pick up an hf rig for my anticipated upgrade to general. I've fount the following rigs for sale in my area a icom 751 for $500, kenwood ts520 for $225 or a kenwood ts830s for $300. I'm trying to decide which rig is the best one for my needs. Does anyone have any experience with these rigs.

Thank-you

The TS-830 is a great starting point on HF, don't be put of by the
"valve thing", I'd never used a valve radio but found it easy to pick up
tune up procedure etc, and I can honesty say I enjoy operating it more
that my other HF radio(an ICOM IC-706IIG).

Hi Sherrill.

Although this is the TS-830 reflector, I wouldn't recommend a TS-830 or anyother rig that is 25 years old as a first rig. Just read the post on this reflector and you'll see about resistors out of tolerance, relays that stick and basically a group of folks that get pleasure from keeping old classics on the road.

The IC-751 was plagued with problems. So many problems that after fixing the design issues Icom renamed the unit IC-751A.

The 751A is an excellent rig. I had one for many years. Dual VFO's, quadruple stage IF, and many more features that made it an excellent DXpedition radio as well as a super contest radio.

Again the rig is about 20 years old and stuff like displays and other componenets are not readily available but I would go that route.

Again, if your Icom is the 751A then go for it. It it is a 751 then run away. I don't care what the seller says. Run away from it.

As a first radio I would really recommend a solid state no tune type transceiver. Something with a built in antenna tuner is a plus. But a modern rig will get you used to operating in with today's technology. You'll have dual VFOs memories and other creature comforts that make life easier.

Do look at receiver performance. This is very important.

You said these were your choices. I assume that you are buying locally. Good idea but it limits your choices. If you belong to a club seek the advice of an experienced ham. Someone that could go with you to check out a rig.

Good luck on the upgrade.

73,
Norm, W3IZ

Hello Sherrill,

from the point of view , what is the
best rig depending on what you have to pay for it,
I would say the TS830.
It is my first choice, if I do compare rigs around the
time from 1982 to 1986.
But it is a rig with tubes in the amplifier, so it is not so easy to handle
for a newcomer.
The IC 751A is a good rig ,as Norm mentioned, forget the TS520. But as he
said it must be the 751A not the 751.

forget the TS520.

Why ?
Just because it has Analogue readout ?
Because it has no WARC Bands ?

Be Fair please. It's a darn good 'starter' rig. My 530-SP is still here, bought secondhand [*] in December 1997.I have had the covers off twice to blow dust out. Same Finals & Driver - Still giving a good 100 watts on all bands. Still getting good reports using a 444 Desk Mic.

OK I use my 530S more these days - That I have only had four years and blown the dust out of once. OK Power is starting to 'drop' on 15 & 10 but the new Valves [not Chinese] are in the drawer.

For a cheap and cheerful rig that, looked after and nursed a bit [ie: RTFM for tuning up] You're not going to get much better, than a '5' or '8' series.

Buy a decent Dummy Load, learn how to drive it, and get hours of pleasure.

[*] Probably third or fourth hand <smile>

Hi Sherril,

I've used both the TS520S, and the TS-830S, when I was a General in college , in the 80s. Both were fine rigs. I also have at the present time, a TS-820 (which I absoloutly love).

The 520, and the 830 are still fine rigs. Don't get put off by them having tubes (tuning them up becomes second nature in a very short amount of time). BUT, realize that they may not ahve some of the things that modern rigs do have. The TS-520 is only 80-10m, whereas the TS-520S has 160m. Neither of these two rigs will have the WARC bands. Both use dial readouts instead of digital readouts (no big deal in my opinion, but some people don't care for dial readouts at all). The TS-830S does have a digital readout, and there was an external digital readout available for the TS-520 series (you'll have to do some looking for this). While there were narrow filters available for the TS-520 and TS-830S, yours may not have them in it, which means you may have to do a little searching for filters (if you want them). Both of these rigs use High impedance mics, unlike todays rigs. Like the filters I mentioned above, you may have to do a little looking for a mic, or order one from a palce like Ken's Electronics. Also, don't forget that the TS-520 & Ts-830S are possibly 20-25 years old, which means that they may need some servicing. Also, while the 6146B finals the TS-5200 & TS-830S use are not as expensive as the 6JS6C tubes used in the Yaesu FT-101 series, they can still be pricey (as much as 80-90 dollars for a set).

OK, enough of the bad points. Here are some good points to consider: 1.) If you take care of the finals, they can easily last you a good 20 years; 2.) Because they are tube rigs, they have great transmit audio on SSB; 3.) You will notice that the receivier is pretty quiet, compared to some of today's rigs (not as much white noise) 4.) The TS-520 & TS-830S are much more forgiving of antenna mismatches/high SWR, than solid state rigs (you can even use the Load control to help better match up the radio to the antenna), 5.) If you ever have a problem with these radios, they are much easier to work on than today's radios. In many cases, you can do the work yourself (I fixed my TS-820, when I had problems with it recently).

So, the TS-520 and TS-830S have both good and bad points to them. Spend some time, thinking about these issues before you go out, and buy that TS-520, or TS-830S you've been thinking about. OK? If you can live with their limitations, you'll love these radios, and have a blast using them. If you can't live with the limitations they have, you'll wind up hating them. Don't base your decision purely on the price tag. After you buy a radio, you have to live with it.

73,
Ellen - AF9J

forget the TS520.

Why ?
Just because it has Analogue readout ?

No but it is a double superheterodyne and a low noise
pll and the most important thing, the first mixer double balanced and is
able to work with strong signals.
And there is a very good accessory out there, a second vfo with 20 Hz steps
(of course after modified).
Yes and you are able to work on the WARC bands.
But if you could get a TS520 for 225 dollars or a TS 830 for 300 dollars
what is the better choice.?
I think , the TS 830 is.
By the way in 1983 I got my general license and my first rig was a TS 830,
and nowadays 23 years ago
I do have two of them,hi.

Hi Folks

I'm looking and searching the web for my TS-520 SE instruction manual (NOT the service manual). But I can't find the SE-instruction manual. It is a little bit different then the TS-520S
instruction manual.

So, is there anybody who has the TS-520 SE instruction manual (NOT the service manual) as a PDF file or knows where I can find it.

It would be very nive when.....

From: Ruben Echevarria
Topic: 7277 Message: 7277

Hello Group Ruben KA2HHB here:
I just wanted to ask the group for a bit of help. I can't get any "PLATE" current on my rig. I thought that maybe it needed finals and driver so I changed them. Still nothing. Have receive but zero power output. Every now and then I'll get uncontollable rise in "IP" and then zero, nothing. After trying several different sets of finals and drivers I'm about to pack it up and send it out. Anyway the question is, any ideas or thoughts on what the problem could be? BTW I also cleaned the relay.
Also anone the the difference between the Gold Face and Non-Gold Face TS830S?
Mine is Gold ..... Thanks in advance ....

Hi Ruben

- Do you set the SG-switch to ON (Rear of the TS-830)
- What says your plate current?

"... Also anone the the difference between the Gold Face and Non-Gold Face TS830S? Mine is Gold.."

Intersting question. In my opinion the label " Kenwood TS-830S" in front, below the VFO knob is ALWAYS golden!!!

Sorry about my late reply...life has been crazy lately.

I had a 520s....my first HF rig. Really nice to start with.
The 830s will give you the WARC bands too. If the 520 you
are looking at is not the 's' model you will not have 160m
if I recall. I would spend the extra $75 for the 830s and get
many more bells and whistles and tools to work around any
qrm. My first HF qso was to a special event station on a friends
830s...the way he was able to shift the filters and IF to get past the
other noise was really slick. The 520s I got in a trade around then
was not able to do that. Don't get me wrong, it's a good solid
rig and a great spare. The 830s just gives you more bands and
options to work with.

-Hello Ruben You should check the value off the resistors in series with the cathodes off 6146 PA valves . You can do this on PC side off output panel There are either 2 or 4 in parallel and should read 5 ohms . also check the screen resistors they are carbon composition and go high .IF in doubt replace these with carbon film resistors 1 watt DO not fit any higher wattage in cathodes as these are designed to fail safe if you have a p a problem Finally check that on Tune you have aprox 125volts on screen and on ssb you should have around 250 The screen reduction volts are supplied from a divider off 2 resistors and if btm goes o/c you have high volts on tune conversley if top RESISTOR o/c you have no volts on tune. What H T voltage is shown on meter this should be 800 volts plus . If a lot lower suspect a faulty smoothing cap . PLEASE take the most care when checking the high yoltage . and remember to allow to discharge and check it is zero before working on p/a etc . best regards BOB

7287. Pick-off IF Signal From TS-520S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-18 02:51:43 UTC
From: n3hkn
Topic: 7287 Message: 7287

I want to pick-off the IF (after the VFO) signal from a TS-520S. My intention is to use a SoftRock SDR at this point. I tried to connect the antenna input of the SDR to the point where the signal goes into the SSB xtal filter. From my reading of the schematic there should be a wide-band (wider than 2.5khz) fixed frequency at this point. It appears to be at a frequency of 3395khz. However, I see no signal on the SDR when tuned to this frequency using a PicEl/DDS-60 VFO in to the SDR. This is probably due to the bandpass filter of the SDR which is at 7mhz(40 meters). I will try bypassing the filter to see what happens.

My question is - is the input to the xtal filter at 3395khz? Is this a good point to pick off a signal?

Date: 2006-04-18 18:07:24 UTC
From: jovem_cao
Topic: 7291 Message: 7291

Greetings!

On my usual bias check to see if it was on 60ma I noticed the needle
is irregular. It is not completely stable when I put meter on IP, mode
LSB or USB and tune on.
Is this something to be worried about? It floats just a very little
bit, but never saw that on my previous TS-520se.

Thanks and best 73!

Sergio CT2IWG

By first tuning into a DL you will get the rig "in the neighborhood" without a lot of stress on the rig. Then switch to the antenna and fine tune.

From: Ellen R
Topic: 7296 Message: 7296

Hi everybody,

As you know, I got my TS-820 going. BUT, the Phillips finals are on their last legs (I can get maybe 40-45W out of them [into a dummy load], and yes, I get plenty of drive from the 12BY7A). I'm NOT about to put those piece of junk chinese finals back in my baby, especially since they flashed over the last time I did it (no thanks to the dirty/hard vacuum in them). I'm getting a nice bonus from work on Thursday, so I think I'll use some of it to buy some new finals.

OK experts, I have a question or two. I assume that I'm going to have to use NOS (I don't even know of there are any Russian or eastern european 6146Bs on the market, much less, how good they are). What brand should I use? Should I go out and spend extra money for the Sylvanias, RF Parts insists we should use in our Kenwood hybrids, or are there others that work just as well (or even better), that cost less money? Also, on a lazy note - will I have a good chance of not having to neutralize my rig for the new finals?

73,
Ellen - AF9J

You'll still have to neutralize the rig. This process removes unwanted feedthrough capacitance and prevents VHF parasitic oscillation.

Refer to the manual.
Be careful as you will be in the HIGH VOLTAGE section of the radio.

7300. 830S Mode Swith Cleanable ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-19 14:50:54 UTC
From: compdsgnr
Topic: 7300 Message: 7300

The mode switch on my 830S is getting noisy. Is it possible to disassemble the wafers and use contact cleaner on them ?

Tnx

Thanks for the reply Ellen. I have had good experience there so far, although just a couple small purchases. I will follow up on your info. Let us know how it goes down the road. When you put proprietary plug with a cable and a mic into play....that be cheap.

You can always buy a good high end audio cable if you want to extend from Heil. The last batch I bought was very limp and easy to deal with at about a buck a foot. In other words...nor rigid or twisty. It was nice.

7302. TS-830 no ALC in Tuning

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-19 17:45:26 UTC
From: alpyke
Topic: 7302 Message: 7302

Hi All:

I'm a new member of this group and a new owner of a TS-830S. I'm having some trouble getting it tuned up, and would really appreciate any advice, help, guidance, suggestions etc.

The problem is as follows:

1) I purchased a TS-830S off ebay. Prior user says it works. Who knows...
2) I've used it in receive only for a week or so, and it works fine.
3) I connected a dummy load (50 ohm) to the output, and tried to tune it up. I've tried at several frequencies, with the same result:
4) Following the procedure in the manual, I set the IP to 60 ma. This works no problem. It was set to 70ma from the prior user, I turned it down slightly with the knob on the back and that works.
5) The next step is to "peak the ALC". Here, when I set up according to the manual, I get nothing on the meter for ALC, and also nothing on the output power meter I have with the dummy load. (I also tried FYI without the external power meter in the circuit, only the dummy load, just in case there was a problem with my power meter. Same result, ALC=0). To check the dummy load, I disconnected the ANT cable from the back of the TS-830, and measured 50 ohms on the end of the cable that plugs into the TS-830. I've also tried adjusting the CAR to both extremes, same result.
6) I can see that the 2 final tubes (6146B's) are each glowing. Also the tube that drives them (can't remember the number off hand) is glowing.
7) I haven't made any measurements, but I can if anybody knows (precisely) what I should measure. I do not have a VTVM, but I do have a DMM, and Analog multi-meter and a scope available.

Thanks for any suggestions.

73 - Adrian, KB1NFW.

7303. Re: [TS-520_820_530_830] TS-830 no ALC in Tuning

Yahoo group: TS-520_820_530_830 (2006)

From: Richard Harris
Topic: 7302 Message: 7303

Adrian,

Welcome to the group.

You didn't mention what position the MODE switch was in. I suggest that you start off in the TUNE position. In this position there will be no standing plate current because the screen grid voltage to the PAs is reduced. This protects them against damage from excessively long tune-ups. Select ALC on the meter switch, set the carrier control half way and see if you can peak the reading. You should also be able drive up the plate current, which is another indication, but I wouldn't expect that you would get much more than 100mA. in the TUNE mode.

If you have tried tuning with USB or LSB selected then you would not get any ALC indication or any output, which is much as you have described.

I have a TS-530, which is the down-market version of the 830. In the TUNE mode I get about 12W output. Having peaked the drive and tuned the PA and ATU, I then quickly double check by selecting CW and keying. You should get about 100W. Don't keep the key down for more than a few seconds.

Be sure that the SG switch on the back is on. You will only get a carrier on tune or CW. Carrier control should be fully clockwise..

7306. Re: TS-830 no ALC in Tuning

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-19 20:52:44 UTC
From: Ellen R
Topic: 7302 Message: 7306

Hi Adrian,

More than likely, the suggestions the other hams in the group have made will solve your problem. If you still have no ALC, after checking for the things previously mentioned, you might want to check one other thing - the 12BY7A driver tube. Usually if these are taken care of, they last a long time. But if they're worn out, you can end up with no Drive, and as a result, no ALC. I had this condition exist, on both a TS-520S, and a FT-101B I had bought, in college. In both cases, I was trying them out for the first time. I replaced the driver tube in each rig, and they tuned up fine, with plenty of ALC.

73,
Ellen - AF9J

7307. Whats your experience buying Hybrids off e-bay ??

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-19 21:50:24 UTC
From: ke9zm
Topic: 7307 Message: 7307

I have been on this group for about 2 months. I have read a number of postings that indicated that the radio was bought off of e-bay and it had some problem that was not disclosed by the seller.

Just wondering, for those folks who bought any of the hybrids off of ebay, how many folks got a radio that didn't quite work. That might be some good proactive info for those who are planning a purchase from e-bay

Having read the ebay autions for hybrids for the past 2 months I observed that about 1/3 to 1/2 of the folks offering these radios for sale have no idea of what they have. When they say "100 W out on all bands" it is most likely NOT a measured output but just something the seller copied from some source. The same goes for pretty much the other content of these ebay seller descriptions.

As for me, I bought 2 Hybrids off ebay. The sellers were hams and they knew what they were talking about. The third Hybrid I bought from a ham store. It was checked by a tech and had a 60-day return policy.

I think I paid a premium price for all three radios. But I am also risk averse and prior to purchase I sent e-mail to the sellers asking them very detailed questions about the actual operation of the radio. To the extent they they could answer and the radio was in good working order, I placed by bid.

So that's my e-bay experience buying hybrids - whats yours?

Gary / ke9zm

Hey there,

AL2N from Anchorage here.

Been looking for a new rig withing my price range and these hybrid's look appealing to me. Something about knobs and tubes seems interesting. I like to use older gear and see how well I can perform with a minimum amount of cash spent.

Hoping to learn a few things to help me in my purchase and maintenance of whatever rig I end up buying.

Been looking at the 520s and 820s as these are within my price range and seem to have great reviews. I mainly work digital modes and cw (been 8 months with no cw practice, ouch!). SSB is fun, but does not seem as challenging as the other modes.

Hi Gary et al.
As one who has bought and sold these kinds of rig on the web, I have to agree that Gary's advice to ask questions and even get a phone number and talk to the seller is a good business practice.

Read the descriptions carefully and don't read anything into them. Assume nothing. If you are not sure or the seller is not sure then stay away. There are plenty of radios out there.

Most folks who get burned in any deal, radio or otherwise burn themselves. They get way ahead of themselves and fall in love with the product or the promise of what the product will do for their ego, personality or status.

Also, as I may have stated before, bargain is not a bargain if it arrives damaged. Specify exactly how you want it packaged and don't be afraid to pay a little extra to have it insured.

Buy and selling on line may be a little different than in person but the basic princple of the deal are the same. Once it is done it's over. You have to ask your questions ahead of time and listen to how the answers are phrased.

Good luck and good bidding.
73,
Norm, W3IZ

Thanks Paul,

I could not find a 7 pin din plug there. I'm trying
to locate for another person. Do you know if it's a
mini-din plug or regular or the TS-530SP? I saw 5
pin, 6 pin and 8 pin there, but no 7 pin.

Tnx for the help.

7311. Another issue raises its ugly head - VFO drift

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-20 02:05:54 UTC
From: Ellen R
Topic: 7311 Message: 7311

Hi everybody,

I need to tap into your expertise again. Late this afternoon, I was getting some use out of my TS-820, on 40m CW, when I received a little suprise during the QSO I was having - a drifting VFO. This wasn't just a 100-200hz, it was at least 2 KHz or so, over the course of a 20 minute QSO. The station I was QSOing with, N1MS, not only commented about it on the air, he even commented about it, in an e-mail he sent me after the QSO was over. The rig he was using was an ICOM IC-756 Pro II, so I doubt very much it was his rig that was drifting. This was only the 3rd time I've used the 820 on the air (I've been either too sick, or too busy for hamming). Could this be related to another problem I'm having? - transmit freq. is slightly off from the receive freq. [the manual says to adjust the 9V supply to fix this problem]). Or, could it be something else like the electrolytic caps in the radio (especially in the VFO) drying out with age (Japanese capacitors of my rig's vintage, are notorious for drying out as they get older)? Thanks for any input you might have in this problem.

73,
Ellen - AF9J

I just got an e-mail, from WD5ABC, who worked me shortly before the QSO mentioned down below. He told me that he noticed the VFO drift too, but that it didn't happen, until we had been QSOing for about 15 minutes or so. So it's possible that thermal/heating up effects on one of the components could be causing the drifting. Any ideas which one people?

Topic: 7307 Message: 7313

Hi Gary,

I bought a TS-530SP from a UK ham on e-bay and have been delighted with it. The seller was prepared to drive a total of 100 miles to meet me half way (on the busiest motorway in the UK on a Friday afternoon) so that it did not have to sent by courier.

It was completely functional and I have now been using it for two years.

The normal claims for electronics stuff on the internet is that "I have no way to test it". Usually an outright lie. It just gives the seller cover. However, buying anything on eBay is a risk. The seller rating is about the only valuation you have of their honesty. Ham gear probably carries slightly less risk due to the fraternal nature of the hobby. I bought my TS-520S via eBay and am satisfied. Paid $275 and it works with the original Japenese tubes in it. It does put out 100w. It is really you personal choice as to risk. No one can really help you there - it is you money.

Gary

Your email raises some interesting points. I have bought several radios over the internet in past years and I can add some experiences to yours. I am in no way 'bagging' Ebay here in Australia ... but I feel there are real risks when dealing with someone you don't know, who may not know anything about the radio, ... and who may reside on the other side of the country. If there is mis-representation during the sale it can be difficult to resolve any disputes.

1. I "won" a Yaesu Ft-___ solid state transceiver ... that had seen better days. Although described in reasonably glowing terms ... I was not prepared for its condition. The case literally fell apart in your hands. Postal services had not damaged it ... but some heavy-handed internal examinations had ruined its appearance. Luckily it worked well ... it was stable and and I got excellent audio reports from other amateurs. When time came to sell it I advertised it on a amateurs-only website ... and tried to give a balanced picture of the rig. The person who did buy it was happy with what he got.

2. I also "won" a Tentec transceiver ... which was/is excellent. The owner was an older gentleman ... and wrapped his 'pride and joy' up carefully ... and It arrived as he described it ... and I remain 110% satisfied with that transaction.

3. I bought a TS-530S ... on Ebay ... and although very heavy ... it arrived in good condition (thanks to careful handling by our postal service). It was by and large as described ... and I only got rid of it because in a foolhardy moment I decided that I didn't need another 'hybrid' radio. No concerns about the seller's description.

4. A Yaesu Ft-1__ that I won came in at such a low price I was really pleased. Although it had been by the sea for some of its life ... it continued to function well. It was eventually moved on to a friend ... who was well pleased with its performance.

My guiding rule is to listen to my instincts. They usually say something is not right ... and I drop out of the bidding.

Prices are frequently higher than I figure a particular piece of gear is worth ... but I think that is because some buyers cannot tell what a piece of 15 or 20-years old electronics is really worth. My maximum price usually has a built-in ceiling to allow for a little work to correct little problems that the seller forgot to mention.

Even if I want the gear ... I have a clear idea of the maximum price I will pay (allowing for postage) and I try to stick with it. I have questioned the seller ... but I find that's of limited value because it was their dad's ... and/or they will not admit to knowing anything. Most sellers use a pseudonym ... and often you get limited information of who and where they are. Willingness to hand over hundreds of dollars to strangers is not part of my upbringing ... and I don't sleep too well on it.

I much prefer to buy and sell amateur gear on a local site run by an amateur (VK2CA). Listing gear with a photograph is possible (and free) ... and I am more comfortable in dealing this way. At most times there are upwards of 400 pieces of gear advertised in this site. I can ask (phone/email) the seller (usually an amateur) why he thinks this gear is worth so much, is he interested in a near offer, what work was done on it ... and how long he has owned it. Answers to these questions (and a possible on-air test) give me valuable information about the value of the gear.

(http://www.vkham.com) is my preferred site ...

That said I looked over Ebay today ...

I would agree with the last part of this statment if the equipment is actually being sold by the ham owner. Much ham equipment on ebay is sold by selling agents and people who buy to resell. The listings are absolutely full of mis-statements about the rigs specs and features, without even considering whether the equipment works or not. I have recently seen microphones sold as transceivers and tons of solid-state rigs with 200 watts "output" (should be "input.")

Personally, I have had good results on ebay when dealing with the ham owners themselves. The best strategy is for the potential buyer to become as familiar as possible with the equipment in question and if he finds an error in the listing, suspect everything. Non-hams do not even know how to test the equipment and they do not understand our tradition of fairness. For these reasons I do not buy ham gear from non-hams unless it is super-cheap.

Hi Gary,

Just to give you a balance to Richard's comments, I bought a TS-530 and a TS-830 from different individuals on ebay. They were reportedly working properly, but they each had problems. They both came from hams, and I do not think either individual was actually aware of the issues. Many people tend to operate on only certain frequencies or modes, so they do not actually monitor the overall total operation of their equipment. Or else, they have not used it in some period of time, and they assume that it is still working properly when being taken out of storage. People's expectations also come into play. For example, 75 watts is just as good as 100 watts for some operators, and knowing that their signal is somewhere inside a given band as opposed to knowing within a hundred cycles or so of exact frequency is fine for other operators. People are just different. When I buy something on ebay, I do not expect it to be fully functional when it arrives, and I am usually not disappointed.

I think there are at least 3 categories of sellers out there. Those who know there is something wrong with their equipment and try to hide it, those who believe everything is ok with their equipment but it actually has some problems, and people who know their equipment is actually operating correctly when they ship it - and the stress of shipping actually causes problems. In any of these cases, buyers of older equipment need to be willing and able to undertake repairs when they buy it, and be prepared to maintain/repair it during the years they use it - because parts do fail with time and use. If someone is not capable or interested in doing the repairs themselves, there are members of this group, and others, who will provide assistance.

As you suggested, try to exchange information with the seller (email, telephone, etc) and determine as best you can the actual condition of the equipment before buying it. There are good honest people who sell/buy on ebay and other sites, and there are dishonest crooks out there too. I have bought from both, and learned from the experiences. One seller refunded all my money - including shipping - and told me to keep the equipment. Another seller was totally unaware of the problem and sent me parts, provided coaching assistance, and sent me test equipment to help me repair the problem. So don't give up on human nature because of a few bad apples in the barrel. (I'm not even going to comment about the "bad" guys). I imagine each transaction has some type of story to tell about either the equipment or the people involved.

Enjoy the hobby.

Topic: 7307 Message: 7318

Hi all. I have bought two hybrids, a TS820S from an auction and a TS830S from a ham nearby direct. The 820 I got at a price that was bargain basement, well below "ebay." it has had a variety of minor issues... Something in the PA area is knocking out the cathode resistors, and I'm still working on that. The digital display didn't work, but a friend of mine was able to fix it. But overall, the radio is in good working order and just needs some typical maintenance. I believe I got exactly what I paid for, and I'm happy.

My 830S was from a ham nearby, who claimed it was 9 out of ten. Well, I love this radio and I use it every day, but the cathode resistors needed replaced, the alignment between USB/LSB was off, the S-meter needed calibrated, it needed the bandswitch repair, and 30m had ok receive but no transmit. How he could call this radio a 9/10 I don't know, but I do still feel that I got an acceptable deal for the price, it is a good working radio that is 20 years old and after some typical maintenance work it performs like a dream.

I think that a person who is buying these older radios, is going to end up in one of two situations. (1) if you buy from a ham, and you really grill the fellow about what he has done with the radio, how it was operated and how it performed, you may very well get a unit that is in primo condition. In this case you may very well pay a premium. (2) if you end up buying from an auction, or from someone who doesn't know what they have, you probably will end up with a radio that needs work. If they said it works fine, it probably needs typical maintenance. (if they said it needs work, it is probably a major rebuild job).

So I think when buying these older radios, it is best to acknowledge that you are buying some work... Unless you paid a premium from a really knowledgeable person. Don't get me wrong, I think those are good options. For a cheap price, and some reasonable maintenance, you can get a radio that works beautifully. I am completely happy with both of my purchases, and the ongoing maintenance I am doing with the radios. I knew I'd be getting a learning experience along with a radio.

e-bay ??

Hi Gary et al.
As one who has bought and sold these kinds of rig on the web, I have to agree that Gary's advice to ask questions and even get a phone number and talk to the seller is a good business practice.

Read the descriptions carefully and don't read anything into them. Assume nothing. If you are not sure or the seller is not sure then stay away. There are plenty of radios out there.

Most folks who get burned in any deal, radio or otherwise burn themselves. They get way ahead of themselves and fall in love with the product or the promise of what the product will do for their ego, personality or status.

Also, as I may have stated before, bargain is not a bargain if it arrives damaged. Specify exactly how you want it packaged and don't be afraid to pay a little extra to have it insured.

Buy and selling on line may be a little different than in person but the basic princple of the deal are the same. Once it is done it's over. You have to ask your questions ahead of time and listen to how the answers are phrased.

Good luck and good bidding.
73,
Norm, W3IZ

Ebay would be my last place of choice to buy a
transceiver. I buy most of my hamradio gear from
QTH.COM. 95% of the sellers are hams and when I'm
interested I email that person and ask some well
thought out questions. I usually can tell right off
from their reply. Before I close the deal I usually
make a phone call to them with any unanswered
questions and discussions about the radio. At that
time I can also make an offer of a lesser value if I
think it more in line with the price I had in mind. I
have not been burned there once.

Of course any used piece of ham gear bought unseen can
sometimes be other than described, but actually
chatting with the seller even if it is small talk
makes us feel like buddies...so who wants screw a
fellow ham?
If you are a real newbie this may not work as well.
So maybe have your Elmer or another ham call.
Works for me.

Hi Walt,

It happens on both receive and transmit. Both WD5ABC, and WB7AVF (who also belongs to this group), told me that it started to drift when we'd been QSOing for a while (20 minutes to 40 minutes). I also begin to notice that the other station is off of my frequency. Earlier tonight, while QSOing with WB7AVC, the TS-820 behave itself for about 1/2 hour or so. Then it began to drift to the point where we were about 1 or 2 KHz off from each other (at least according to my RIT). ALL hams I've QSOed with in the past 3 days have commented about how I was drifting. It actually made it hard for both sides of the QSO, to keep it going.

73,
Ellen - AF9J

I know that the 9V supply can be off. In my case it definitely is, because the receive freq. seems to be off from the transmit freq. (even on SSB). So you're saying that it can drift in both transmit & receive? I assume that I'll have to order another regulator from mouser to replace VR4?

I bought a Kenwood 520 on eBay for $240 in '04. It was sold with an Astatic Mic a speaker and extra tubes. When it arrived it was packed in just foam peanuts half of the extra tubes were broken, the radio tore a hole in the metal screen of the speaker (not an original), and the dial on the radio was frozen. I took the front off the case and disassembles/reassempled the dial structure and now it moves smoothly. The power cord still fits loose but it works like a dream. The external speaker works fine but looks funky, and the Mic has been absolutely wonderful. I slaped up a G5RV and ran it without a tuner on all bands. I have worked all States on it and had several DX QSOs including one from Antarctica! I have since bought another radio and passed this one to my son who is now using it. All in all, I believe I made a good deal, dispite my original disapointment when it arrived.

Adrian - I have the same problem with an '830. I have found several references to that problem and the suggested solution is to replace the driver tube. I've tried 3 different new-old-stock 12by7a's with no success.

VR-4 is a trim pot that controls the 9v regulator. I replaced mine with two fixed resistors that gave me exactly 9 v. Also, the reason that I asked if it was drifting on both TX and RX is that the contacts on the back of the VFO capacitor become dirty. There is a metal cover that can be removed and on the back of the capacitor, there are contacts that ground the rotor plates to the case. These often need cleaning in an older rig. Craig Do-Oxit works well. Rubbing alcohol is a lessor substitute. Do not use WD-40.

And PLEASE everybody, no posts about WD-40.

Also while you are in there, turn on your calibration escalator and tune it for a tone. Poke around inside pushing with an insulated tool looking for intermittent spots. The first place to poke around is the AF AVR board. BTW, does this do this on LSB ? Do you have the operating and service manual ? I am going to be gone until Tuesday so don't anybody feel offended if I don't respond to messages during that time.

hi,

I've had great results with all my
ham gear that was obtained from
sellers on ebay with high feedbacks (500+)
and with very low feedback but no negative.

be sure that the seller understands what
double boxed means, not sending the stuff
in two seperate boxes !

the ups crew must have been hams otherwise
my ts520 with accessories would have been
a pile of junk as the poor packaging would have
resulted in a denied claim.

I must admit, if it sounds too good, it is,
once in a while there are some good deals,
like the ts-600 that was on buy it now for
$ 165 ! I did not need it so I put a low bid
on it so the bin would go away, it sold for $ 365 !

I did jump on a ts-50 + at-50 $ 200 !
from a ham in my state, he was getting out of the
hobby and was giving away all his gear at reasonable prices.

I've only used email to ask/answer the questions,
many many good sellers out there that move a lot of
estate goods and the same stuff is at the hamfests.

One good rule, don't get into a bid war, if you just
gotta have it, then get it local where you can see and
touch it and get to operate the gear before you buy it.

Check completed auctions first before you buy, see what
the items are going for. Also check the sellers previous
auctions, did he just buy that 520s for $ 120 as a parts rig
and is now trying to flip it for $ 275 ?

Another factor is the ship fees, try to get the gear from
sellers close to your qth and use fedex home if possible,
it is less expensive then ups ground.

7333. TS-530S Sudden Low Output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-21 22:00:30 UTC
From: Stephen Davis
Topic: 7333 Message: 7333

Hello All,

I have a TS-530S that has been working fine and is my primary rig.
This morning I go to tune it for 40 meters and notice low output. I checked the bias and it was down. I adjusted the bias back up to 60ma and then tried re-tuning. The best I can get is about 40 watts out. Tried tuning on 20 meters and got same low output. Hooked up a second dummy load with meter and still same results. Last night it was putting out 100 watts on 40 meters. Any suggestions on what could be wrong? Would one or both of the final tubes "get sick" over night? What would cause the bias to drop from the required 60ma to about 10ma overnight? This was the value until I cranked it back up via the rear bias adjustment. Any suggestions would be appreciated. I am thinking that I need to pick up new finals, but not sure that is the problem.

Thanks

Steve K7QHU

From: Stephen Davis
Topic: 7334 Message: 7334

All,

Sorry, I made a goof! I was reading the wrong scale on the dummy load watt meter. The output is only about 4 watts, not 40 watts as I stated earlier. The output in tune mode is about 2 watts. I checked the screen grid switch at the rear of the radio in case it had gotten bumped and it was ok (in the "ON" position).

Thanks

Steve K7QHU

7335. Update: TS-530S Sudden Low Output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-21 23:18:52 UTC
From: Stephen Davis
Topic: 7334 Message: 7335

All,

I must be having one of those "Dumb Days". My original post regarding the output was correct. I get about 40 watts out in CW mode and in Tune mode about 8 watts out. So my problem is still as described in my first post.

Stephen First check using your meter [built in] check your HT
is around 800volts could be that 1 off smoothing capacitors have
failed [there are 2 in series] if this is case it could be as low
as 400volts. If ok then next check using a test meter check Screen
voltage on the output panel and check that this reduces when you go
to the Tune position to verify the screen grid network is good . Are
other bands also low . good luck BOB

Topic: 6800 Message: 7337

Hello,

I have the same problem with a TS-520S, and see that you message never received a response, at least not on the list...

To me the tuning feels "grainy" or "bumpy" as the knob is turned, but if I push "in" hard enough on the knob/shaft then it seems to be ok. Some backlash has developed at one point of rotation.

Has anyone dealt with this and have advice/observations to offer on possible remedies? Is a teardown and fixup of the vfo geartrain etc. usually enough to do the job?? Or is the problem typically a result of irreversibly worn parts, making a vfo transplant the better option?

I've been spoiled by the silky smooth tuning of my even older TS-520 and would like to get this one up to snuff.

Thanks,

Bob NW8L

7338. eBay purchases of Kenwood hybrids-latest experience

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-22 17:42:46 UTC
From: stevehurstg8lik2003
Topic: 7338 Message: 7338

Hi,
I recently posted details of a Kenwood TS520SE and the rather superior TS830S bought off ebay.
Today the postman arrived with a TS520. The original -and basic I guess, but for £127 plus shipping from Northern Ireland (well boxed too) it does not seem a bad deal despite the lack of 160M band.
Power out was found to be fine, 100W plus on 14MHZ. However when I tried 28MHZ it was only half that. If you looked at ALC in tune position when transmitting (carrier) it dropped from half scale to nothing after a couple of seconds. The cure for that was a 12BY7A driver transplant, all fine now and full power there again.
Seems like a smoker had owned the radio at some stage as the white grooves on the front panel knobs were actually brown making it difficult to see where they were pointing-washing up liquid and a sponge sorted the worst. The internals however seemed in good shape...nicotine and dust free. Audio reports so far are great!
Good luck to all! Lets keep them going!

Best 73's,

Steve

7339. Drifting?

Tnx for the tube report, Ellen. The MIL-SPEC rated finals sound pricey, I must say. A friend in Seattle may send out some more Kenwood goodies, including new tubes, in the box, from Japan. We shall see. QSL our QSY X 2 40M QSo, by the way, after 20m failure. 73 rbb

7340. Hybrid Net on HF - Anyone interested ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-22 21:40:44 UTC
From: ke9zm
Topic: 7340 Message: 7340

I sent out a few personal messages to people that post on this newsgroup asking if they were interested in getting a HF net together. The purpose would be to put your Hybrid on the air with other Hybrid owners and discuss, in real-time, the kinds of things written about in this newsgroup.

The response I got was that eveyone thought it was a good idea. However, myself included, none of the folks were in an excellent position (eg a great antenna situation) to be the first net control. To have a successful net we need someone with a decent/great antenna and at least 100+ watts.

So, if anyone is interested in having a weekly HF net for the purposes of getting your Hybrid on the air with other folks AND discussing Hybrid-related topics.... send me some e-mail per your interest.

More importantly, if you want to be one of the net control operators and you have a station capable of that ... tell me that too.

After a week of so, I will post the results to this newsgroup

7343. Re: TS-830 no ALC in Tuning

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-23 05:06:15 UTC
From: alpyke
Topic: 7302 Message: 7343

Thanks to all for the suggestions:

1) The mode switch is set to TUNE.
2) The SG switch on the back is ON.
3) The CAR knob has been tried in all positions.

I've followed very carefuly the directions in the manual, and all of these settings are mentioned there. I suspect there really is something wrong with the equipment. Anything I could do to confirm the 12BY7A tueb is defective before replacing it? Or is that the easiest course?

Thanks again - Adrian

Topic: 6800 Message: 7344

hallo bob and people who suffer lumpy vfo
lumpy tuning knobs
this is a sign of dried up grease which has got hard
what this means is taking the whole v.f.o out as a unit which includes
the gear train if you take of the gear train be careful of the pre
loaded springs they get lost easy the idea of these small springs is to
pre lode the 2 back to back gears the idea of this is to stop backlash in
the v.f.o. tuning knob and when reassembling pre lode the gear by a
quarter of a turn when meshing it with the smaller gear what this does
takes the slop out of the gear train the hardest part is realigning all
your analogue dials (its better if you can clean the gear train with all
the dials left on) by using a pressure pack cleaner a rather fiddley
process when done do not use thick grease use thin house hold oil the
type that is used for sewing machines (not thick vehicle oil)
then oil the gear train by using a syringe from the drug store the aim
is to get a coating on the bearing surfaces and between the preloaded gears
also on the cogs work this in by running the v.f.o. dial knob a few times
back to both end stops DO NOT GET ANY CLEANING AGENT INSIDE THE V.F.O.
if you turn the spindle with no knob on it will feel slightly lumpy that
will disappear when the v.f.o. knob has been finally fitted all this sounds
slightly complicated (it isn't) approach the job methodically
first remove all the knobs of the front panel remove the for panel under
the v.f.o. dial and lift of Allen key required for this remove the
screws from the sides of the front panel and pull of (this is a good time
to repair those dial lights) also its time to clean all those knobs and
front panel warm water and washing up liquid and a small nail brush
and if those knobs have years of gung on them a cup of warm water 2
teaspoons of bleach and soak them for a day or so no longer when clean
give them a final clean with nail brush and a bar of house hold soap
do not use bleach on front panel just warm water and soap
put in a warm place to dry when dry good time to touch up the front
panel and rim with appropriate paint with the smallest brush artist
really fine one letters and numbers on the front panel a good time to
sort them out they do get worn away a good free standing magnifying
glass (myself I use a jewelers loupe) especially with eyes like mine
they where good once if you don't think you can do this lettering leave it
alone this touch up will make or brake the front panel its very easy to
stuff it up (((practice on something first)))
back to removing the v.f.o. digital camera is the order of the day
take pictures of how it comes to bits note the position of the dials
mark them with a small dot of paint and take a picture make a reference
of everything you do with the camera if you are feeling confident with
your cleaning there is one other job around the vfo .....take the metal
casing of the vfo a couple of screws on the back and inside at the back of
the variable capacitor there is a small brass wiper which gives trouble

de ox this wiper do not touch anything else in there do not touch any
components if you can help it right you have done that now put the
dam thing back together using the diagram in your user manual and
your memory and mot of all those digital pictures ((you did take
some)) OK now I must get to my ft301which is suffering lumpy v.f.o.
dial and requires a re spray and a good clean and partial letters to be
replaced in other words a total cosmetic job and re aligning
this procedure is taken on about 3 Ts 820 that I have been involved in
something else that might help in setting up those analogue dials a
frequency counter
or a near by receiver is a help
all this is from my experience with ts820 / 820s ft 301 and
ft 101 have fun I did and still am

7345. TS-830S breakthrough on receive

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-23 14:59:53 UTC
From: daveb0910
Topic: 7345 Message: 7345

Can anyone help with this unusual problem?

I've had my TS-830 up and running for the last 6 months after a long time in storage. Some minor problems have been fixed (with help from this groups' postings- very helpful thank you) but bascially it has worked fine.

Recently, I have what I can only describe as intermittant RF breakthrough on receive. It happens on all bands, with loud (non-ham) signals appearing across the whole of the band- these are carriers, AM brodcasts and a whole host of other noises. When I switch between bands the breakthrough signals seem to be the same on each band making me think it has something to do with breakthrough on one of the IF freqencies.

This only happens with one of my antennas (a multi-band doublet), and not all the time. Sometimes there are periods of several days when it happens or doesn't, other times it just comes and goes over a matter of minutes.

I'm puzzled about this. I've checked the antenna for bad connections etc but all seems OK. The other main antenna I use, which causes no problems like this, is a similar multiband doublet orientated at 90 degrees to the first one.

AT first I thought this was an antenna or local interference problem, now I am beginning to think it is something in the TS-830.

Any ideas or suggestions about solving this problem would be gratefully accepted.

Dave,
I noticed exactly the same on my recently acquired TS830S-
broadcast stations appearing in the ham bands.
However when the RF attenuator button was operated a few times the
problem went away-at least temporarily.
I attributed the cause as being rectification of strong signals caused
by oxidised contacts in the switch. Certainly its cured....for now.

regards,

Steve G8LIK

Great idea! I don't have the proper antenna to be net control, but I'll certainly check in and be a participant. FYI, antenna here is a horizontal loop under the eaves of the roof - 10 feet off the ground. From my QTH near San Antonio, I made it to Buffalo, NY; NE Minnesota, near San Diego, and South Carolina on 40m last night after midnight. Bad condx, but was lucky before the band really went south.

Check the screws that hold the printed wiring boards. Make sure they're tight. Kenwood uses the pressure of the screws on the boards to make ground contact between the underside of the board and the chassis. Adding a star washer between the board and the mounting frame can cure many intermittent type problems. I believe there was also a service bulletin on the 830 that also identified this issue.

Jeff,

Please provide more details on your antenna - ground plane, feeds, etc.
Sounds like a great idea!

Charles,

Thanks for taking the time to relate all of this good information.The advice
to use a digital camera during the teardown sure makes a lot of sense. So
now I'll roll up my sleeves and go to work - yes, the knobs need cleaning
too!

From: Ravenswood
Topic: 7353 Message: 7353

I can get 130 watts or so on CW, but peak around 50 for voice. Is there a way to get more power in voice SSB, assuming all is well w/the rig?

All of my gear & accessories will take up to 200 watts (tuner, etc.)

Is there such a thing as a 100 watt amp? I'd like to get the full power of output in voice without having to buy another transceiver.

Any ideas?

73, Frank K2NCC

Frank,
are you reading your output on a peak reading meter or just average reading?

What is the ALC and IP reading on your voice peaks?

Are you looking at your SSB sigs on a scope -- SM-220?

Do you have compression on when reading the TX power out?

Norm, W3IZ

Readings are on the AT-230 Antenna Tuner . If I crank up the mic carrier and scream into the mic, I can get it further than 50watts, but it's not the way I'd want to operate, of course.

ALC peaks at the edge of the ALC gauge. MIC/CAR is adjusted to that point.

> What is the ALC and IP reading on your voice peaks?

ALC reading is at the edge of the ALC meter readings (if I understand you correctly.) This is what, if I understand correctly, is recommended by the manual, to avoid overdriving or overmodulation.

> Are you looking at your SSB sigs on a scope -- SM-220?

Nope, I have a 'scope (Instek GOS-620FG), but no idea how to use it w/the rig.

> Do you have compression on when reading the TX power out?

Compression is not a word in my Kenwood manual that I can find. Do you mean AGC or Noise Blanker? Either of these hasn't made a difference.

According to all Kenwood specifications, the radio is operating as it should be. I'm just looking to get a little more power out on SSB.

Thanks for your input, I hope what I've said is what you've asked. If not, please clarify, keeping in mind, I'm a noob. 8)

Jack,

My primary antenna right now is a wire loop under the eaves of my roof, using little white hooks I bought at Home Depot. I think they originally were for hanging small plants, but here we are...The wire is #14 solid insulated. I'm using 300 ohm twin lead from Radio Shack (the thicker, black one; not the thinner brown one). I'm using an MFJ-941B tuner, and it does a great job matching the antenna for 80, 40, 20, 15, and 10. Almost 1:1 everywhere. I do have an MFJ Magnetic Loop for 30 through 10, but I need to get a new control box for it. But for now, the wire loop is working out great! Not sure exactly how long it is, possibly around 200 feet or so. It looks like it used up around half of the 500-ft spool of wire. One day I'll have to get out there and measure it.

Best of luck, Jack. Hope you try it out!

7358. Re: TS-830 no ALC in Tuning

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-24 16:49:14 UTC
From: alpyke
Topic: 7302 Message: 7358

Hi All:

I've done some more work on this issue. With the scope I can see the RF signal going into the DRV pin of the final stage. I was tuning at 160m band, just to stay well within the bandwidth of my old analog scope. The amplitude of this signal changes from about 10 to 100V p-p by adjusting the DRIVE control. It peaks at 100V at a particular setting of the DRIVE control. Still no ALC reading on the meter in this case.
a) Does this imply the meter is bad perhaps? Or maore accurately the signal driving it on teh ALC setting, since it works on othe rsettings.
b) Is 100V p-p about right?
c) What is ALC really, in this case, anyway? Is it something other than the amplitude of the signal into the finals?

I continue with the tuning, on the asusmption that it is actually working, and the meter is just defective. I'm able to continue with the rest of the procedure in the manual. In the end however I can only get about 80 W out max power according to my external power meter (going into 50 ohm dummy load).

It also is not stable. For no apparent reason, it seems that the output drifts up and down, on SSB especially, where I get anywhere from 0 to 50 W max out. Not close to the max capabilty. If I go back and retune, the settings might be slightly different, but then even on CW I might only get 10-20 W. Then I wait a while and retune and I can get more, or less. Never over 100, and usually under 50.

Are my finals or drive tube about to die? Is this a typical death of them, to have reduced power out, or do they die completely at once when they go? I have to admit, while I'm an EE, my studies are all solid state, so vacuum tubes are a new animal for me....

Thanks again for the help of the group... - Adrian - KB1NFW.

7359. Buying Hybrids on ebay review

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-24 17:43:08 UTC
From: Rene Santos
Topic: 7359 Message: 7359

Hello, in my experience buying hybrids on e-bay, I had the lucky to had found an excellent seller, honest and with enough knowledge about the equipment in order to answer your questions.

The name of this seller in ebay is Dukeshifi. When you see a commentary from him that say museum piece, this statement means that equipment is in amazing conditions, like new, like you made a trip to the past and bought in the 80's. I bought from Ecuador to my address in Miami, the packaging is bulletproof. Buy with confidence.

Rene, HC2SA

Horizontal loop is a great antenna. I live in the woods and have had a loop up for 5 years. It's about 525 feet around, up about 40 feet running through the trees fed with ladder line at one corner. Work all bands from 160 through 10 with a TS-530s and a tuner. Find it a great DX antenna for the upper bands. Was able to break through the pile-up to the Peter 1 expedition on 17 meters a while back. Good luck with yours.

From: N3DOK
Topic: 7361 Message: 7361

Hi,

In this months ER Electric Radio magazine. is an ad for this device. The manual indicates it will work with Kenwood TS-520 . TS-511 . TS-900.

The Model DD-103 Universal Digital Dial provides accurate digital frequency readout for vintage receivers and transmitters. It has the offsets for many receivers and transmitters stored in permanent memory so it only requires the VFO signal. It is a direct plug-in with all Collins that have a VFO output. A TCXO provides 10Hz accuracy and .5ppm stability. Available as a kit or fully assembled and tested.

http://www.electronicspecialtyproducts.com/

I have no connection to this company. Passing this information along for anyone who might be interested.

Bob N3DOK

These are some interesting antenna configurations~ I keep hearing about..

I am curious has anyone ever loaded up there Cyclone Fence?

How about hooking to it as a receive antenna..

I am still waiting to take my General test & am really curious..

Recently my receive only went to Hell... Funny it corresponded to me
unhooking the antenna during a shack clean up..:)

If it's a QRP CW QSO, you can use the ALC control to control the output. De-tuning the driver tank circuit, i.e. tuning it out of resonance, is never a good idea. If you want to control the power output on SSB, add a variable 0 to -10 volt voltage source to the ALC lead. If you're going to operate QRP SSB for a long period of time(days, weeks, months), since the 6146's are in parallel, you can pull one, and just operate with one in the final. You should have no problems on the lower frequencies but it might get a bit touchy about 14 MHz.

Frank:
You are getting the full 130 watt peak on SSB. Your meter will not move fast enough to follow the voice peaks. If you had it on a scope, you would be able to se that the peaks go every bit as high as your carrier does on tune up, sometimes a bit higher.

If you whistle a very nice steady tone across your mike, you will find that the meter reads somewhat higher.

Frank,

What kind of mic are you "screaming" into? Maybe you're just
not driving the audio circuits properly. Just a guess.

It is a bad idea. It will run the driver stage out of resonance. It can
also cause spurious emissions.

You can also add a resistor in series with the wire that goes to the terminal labeled SG on the final board. 12K will give about 40 w PEP. A switch can be used to bypass it for full power.

If your antenna tuner is peaking at 50 watts, let me
assure you that you are putting out 100 Watts PEP.
I've got that same tuner and a Bird watt meter with
the PEP measurement on it and it reads 100 watts.
Those older meters without the PEP reading just can't
follow the real power output as they cannot react that
fast.
So quit the hollering into the mike and calm down and
enjoy a SSB QSO knowing you are putting out 100 Watts
PEP, which is about the rating for the radio.

Okay. I'll buy that, but I still want more and the original question
stands. This rig is rated for 200 watts PEP (with a written max
output of 280 watts). Since it's almost 30 years old, I can't expect
much I guess.

Just trying to squeeze out another 100 watts in SSB and wondered it
there was a way to do so.

Thanks for everyone's input in helping me w/my output!

Topic: 7353 Message: 7372

If you're referring to the 200 watts PEP that's listed in the Specifications Page(page 4), that's INPUT power not output power. IP(.250A) times 800 volts = 200 watts input. Unless you have SUPER 6146's, 100 to 120 watts max. output is what you will get. It has nothing to do with the age of the rig. Go to any tube manual and check the plate dissipation specs of the 6146/6146A/6146B/6146W.

You want more power, get a linear. A Heath SB-200 or SB-220 works great with these rigs.

Hi Pete:

I have a TS-830S and also have interest in reducing output power in SSB mode. The "ALC control" you refer to. It is the "ALC IN put" on pin 6 of the REMOTE connector into the back? This is a 0-10VDC signal? 0V is max power, or 10V?

Thanks - Adrian, KB1NFW

It's 0 volts to -10 volts with 0 volts being max. output. A simple
circuit is to use a 9 volt battery with a pot.
Go to the "Files" Section we have here under this group.
See, Under Mods:
Use ALC input to 'force' QRP operation.jpg

And for those that don't want to do the "force" above, from my message
yesterday, let me add a correction. I was doing too many things when I
typed it:
I had to go back and read the message. "Actually, not pull the tube, just
pull the plate cap off one 6146 since you're correct, the filaments are
in series. Or, if you plan on long term, pull the tube and put a 6 volt
lamp of sufficient current rating between pins 2 and 7. Or, put a paper
clip between pins 2 and 7 and put in a 12 volt 6146 (i.e. 6883)." The
"force" method is a lot cleaner and saves having to open up the rig.

7375. Buying or selling ebay or otherwise

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-25 23:34:24 UTC
From: pchapman9202003
Topic: 7375 Message: 7375

I don't think that I have seen this posted in while anywhere, so after all of the ebay discussion and follow-up about packaging, just thought I would throw this out.

If you ship something to someone using an agent for a carrier or if you have bought something from someone who is using an agent for a carrier to send it to you, when it comes to claims, the ownership of the equipment by all legal terminology resides with the agent. This means, using the UPS Store franchise or the Kinko's Fedx Franchise, as examples. If you or the seller do not take the merchandise to a Fedx or UPS genuine company storefront, and the stuff gets busted, assuming correct packaging procedures were followed, you could be SOL completely.

Although I realize that most franchise owners making a profit would not let this happen to you, some that may be in financial straights and about to close the doors would.

7376. Re: TS-820S Drive control / Why not just use the Mic gain...?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-26 02:57:55 UTC
From: ke9zm
Topic: 7362 Message: 7376

Maybe someone can correct me on this. But the easiest way to power down a SSB radio is to reduce the Mic gain. I have a bunch of radios with a monitor circuit. To me, reducing the Mic gain does not diminish the audio quality but can reduce the SSB power out significantly. This seems easier than anthing I have seen described to accomplish QRP. Am I wrong on this?

From: gjcollins@cox.net
Topic: 7362 Message: 7377

Pete,

When the TS-820 first came out, Kenwood sold a "Novice" adapter (it's mentioned in my owners manual). It was plugged in in place of one of the 6146s. Was that just to complete the filament circuit and provide the needed voltage drop for the remaining tube, or was there more that it did?

Thanks,

George, KC1V

Subject: Re: [TS-520_820_530_830] Re: TS-820S Drive control

It's 0 volts to -10 volts with 0 volts being max. output. A simple
circuit is to use a 9 volt battery with a pot.
Go to the "Files" Section we have here under this group.
See, Under Mods:
Use ALC input to 'force' QRP operation.jpg

And for those that don't want to do the "force" above, from my message yesterday, let me add a correction. I was doing too many things when I typed it:
I had to go back and read the message. "Actually, not pull the tube, just pull the plate cap off one 6146 since you're correct, the filaments are in series. Or, if you plan on long term, pull the tube and put a 6 volt lamp of sufficient current rating between pins 2 and 7. Or, put a paper clip between pins 2 and 7 and put in a 12 volt 6146 (i.e. 6883)." The "force" method is a lot cleaner and saves having to open up the rig.

The issue with "damaged goods" due to shipping is way different in the case of these Hybrids. For example, one of the folks on a local repeater shipped his FT1000D (worth about $2500) to AES for some minor repairs. The FT1000D weights about 50 pounds. The shipper damaged the radio and AES confirmed this. The radio was insured, a claim was filed, investigated, and UPS paid to AES to fix the damaged radio.

All fine and good. But these Hybrids are a different matter. Given their age, they are out of the mainstream and hard to find any professional to service them or find parts per a legal claim that a shipper would pay off on.

Some shippers may deem the Hybrid "wothless". These radios are more in the realm of collectors than folks who want a mainstream ham radio to operate. The hybrids are worth something to us in this group but an objective regular person would consider them "boat anchors" of little or no value.

Bottom line, I thinks its "our" (not the shippers) responsibility to get these 35-45 pound radios through the mail with adequate education about packing to the seller.

Eveyone I bought a Hybrid from packed it very well. My story posted on this group previously was about my TS-830S which arrived with a puncture through the outer box, through the peanuts, through the inner box, and then through a few layers of bubble wrap.

If that puncture went throug the front panel of the radio what chance would I have with a claim to a shipper? What chance would I ever have of evey getting the TS-830s fixed? Beter to be proactive with the seller than file a claim with the shipper.

7379. What in the silver box (VFO) ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-26 03:22:00 UTC
From: ke9zm
Topic: 7379 Message: 7379

I have read a bunch of posts here about springs, back contacts, and all sort of mysterious things inside the "silver box".

I looked at mine and its not obvious how to get the over off. There is a cover on the side with 2 screws that are hard to get to.

Wonder if someone could describe what is in the silver box. Or if someone has a picture of a disassembled one if they could sent it to me.

Thanks
Gary / ke9zm

Don't recall if I ever saw one of these plug-in modules. It's not listed as a coded item from Kenwood and the manual says it's available from your dealer. Maybe it was an after-market product from some mom/pop outfit. Roughly a 11 or 12 ohm resistor, at about 7.5 watts, between pins 2 and 7, is probably all that is needed. Also remember that Novices only had CW privileges, so you could use the front panel Carrier Level control when operating CW, to adjust your output power down. In the SSB position, this control won't work for controlling output.

7381. Re: [TS-520_820_530_830] Re: TS-820S Drive control / Why not just use the Mic gain...?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-26 06:56:48 UTC
From: Peter A Markavage
Topic: 7362 Message: 7381

Sure, you can reduce the mike gain, you can whisper into the mike, put the mike 2 feet away from you, etc. but unless you can talk in a manner similar to a constant tone, you're really not reducing your power output. Any inflection in your voice, noise, etc. will kick the power up. You would have no control over your power output. A localized monitor circuit is really no indication how well you sound to the guy at the other end of the contact.

Pete, wa2cwa

On Wed, 26 Apr 2006 02:57:55 -0000 "ke9zm" <ke9zm@...> writes:
Maybe someone can correct me on this. But the easiest way to power down a SSB radio is to reduce the Mic gain. I have a bunch of radios with a monitor circuit. To me, reducing the Mic gain does not diminish the audio quality but can reduce the SSB power out significantly. This seems easier than anthing I have seen described to accomplish QRP. Am I wrong on this?

In researching another query, I see where you got that 280 watts from. Frank said "This rig is rated for 200 watts PEP (with a written max output of 280 watts)" The 280 watts you refer to is listed as the "Power Requirements" on transmit. That's the maximum power that could be drawn from the AC line while in transmit. Has nothing to do with RF output power.

Pete, wa2cwa

Okay. I'll buy that, but I still want more and the original question stands. This rig is rated for 200 watts PEP (with a written max output of 280 watts). Since it's almost 30 years old, I can't expect much I guess.

Just trying to squeeze out another 100 watts in SSB and wondered it there was a way to do so.

Thanks for everyone's input in helping me w/my output!

I bought a pair of 6146W's from K5SVC on eBay for $15.00 each NOS. They are GE JAN 6146W tube dated 4/87 (6146B equivalant). I've had no problem whatsoever with them and they came well packed in boxes. Definitly not the Chinese tubes. :)

I agree with you. The point I was alluding to was about going to the UPS Store or Kinko's to ship something versus going to the Fedx or UPS terminal. There have been articles in the last 2 PC Magazine issues regarding a $1200 ebay sale for an antique guitar amp, and how the buyer was out his money for several months, did not get it back and we he finally recovered the goods several months later, it was worthless from the damage. I could be off some on the numbers, but that is how the story went.

Hello everyone I am a new member of your fine group.
My name is George call sgn. K0GWD.I currently have as
my base station rig a Kenwood TS-530S into a 80M loop
antenna up about 40 ft @ abt. 90 watts.Thru A MFJ 989
tuner.Also have a mc-50 mic. The rig worked great when
I first got it, put out full power on all bands.
Turned it on one day and it would only put out abt 40
watts. I checked the plate voltage and it was abt
400v. Also bad audio reports when prior reports were
excellent audio. All other meter readings during tune
up are normal. Any information would be gratefully
accepted that would cure the old girl.
Thanks George K0GWD

7389. How to align the frecuency

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-26 22:34:37 UTC
From: hc2sa
Topic: 7389 Message: 7389

Hi, sorry for my poor english. I have a TS-830S with 4 HZ missaligned,
for example if the signal is en 7060, I hear 0 bits in 7059.6
What kind of aligment I need to do in order to fix this symptom, just
with my ears because I dont have a standar signal generator.

Thanks in advance.
73's

Check the high voltage power supply. You might have blown one of the
electrolytics. How do you know the 830S is a female?

From: unifiedcourt
Topic: 7391 Message: 7391

I tune the TS-520 into a dummy load and adjust the load, plate, and drive for max forward power which is about 110 watts. I then set the TS-520 on CW mode and finish tuning to a 1.1 SWR at 100 watts output. The specs say this units max output is 200 watts. Is this a normal output or do I have to replace some tubes.....Ron KB2SQY Thanks.

200 watts is the INPUT power of a TS-520. The output will be around 110-120 maximum in cw, although Kenwood recommended limiting plate current to 200 milliamps, which would give an output of perhaps 90 watts.
The peak output in ssb will be higher, and must be read with a peak-reading wattmeter or an oscilloscope, but will be in the range of 120-135 watts, depending on the line voltage and condition of the tubes.
Your 110 watts cw sounds fine. My TS-520S has maximum output in cw of just under 120 watts, and about 135 peak watts out in ssb.

Ah! I see the problem: The TS-520S is rated 280 Watts max AC line input power (120/220 VAC 50/60 Hz) when transmitting, and of that, 200W DC PEP or 160W DC CW *input* to the finals -- an easily overlooked, but important detail!

Note that the RF output will be about 50% of the input power so approx 100W *output* would be expected so it sounds like it's performing to spec, even 30 years later.

7403. ALC circuit

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-27 20:54:03 UTC
From: alpyke
Topic: 7403 Message: 7403

Anyone know how the ALC feedback circuit works in the TS-830S? I trace the signal from the FG signal of the finals to the AF board, then to the IF board, then to the meter (mode switch set to TUNE, meter switch set to ALC). Through it all it is an RF signal at the carrier frequency (if I remember right, ~7.2 MHz). The FG signal at the start is about 20Vp-p amplitude. At the first transistor stage on the AF board it is attenuated and picks up a -9VDC bias, to become a signal oscillating from -13V to -5V but then by the time it gets to the meter (through the other transistor stages of the AF and IF boards), it is of about the same AC/RF amplitude, but 0 VDC biased, and I get no deflection of the meter. Is this signal supposed to be RF by the time it gets to the meter? Is it just that my original 20V p-p is too small to cause an ALC value? What is this meter really displaying? The DC component of the voltage? The meter seems to work on the other settings, so I don't think the meter itself is defective.

Thanks for any help - Adrian, KB1NFW

7408. RFI from Computer Monitors

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-28 08:47:42 UTC
From: Ravenswood
Topic: 7408 Message: 7408

The last RFI beast to overcome in my shop; The computer monitor!

In spite of all my research, I've yet to determine a way to eliminate the noise the CRT drives into my rig.

I get a noticeable, almost two S-unit drop in noise, when I turn the monitor off.

Using the poor-man's way to determine RFI sources, I used an AM radio to determine that the interference is coming out of the 'cut out'; the monitor screen.

From what I understand, it's the sweep circuit, since it's coming out of the front of the monitor and not from it's sides or back.

I could shield the monitor case, but for obvious reason, can't do much about covering the glass, the primary source of noise emissions. Blocking the front w/a grounded metal plate does eliminate most of the noise it generates.

I've relocated the monitor in different places and discovered I would have to rotate the entire shop 180 degrees to make any change in RFI. Not something logistically sound for me.

The path of the RFI seems to be via the antenna. I'm sandwiched between the monitor and the antenna, which is just outside the wall to my back (about 15 feet away.) As difficult as it was to find a place to put it, I can't move it.

When the antenna is disconnected from the radio, there is no noise, so the radio (TS-520) is properly shielded. Ferrite chokes everywhere made no difference, as expected.

I asked a "Display Product Engineer" at CTL (a monitor mfg) and didn't get any other recommendations. I did however, convince him to measure what frequencies are coming out of a monitor. The results he gave me was:

"Frequency on Power supply & high voltage scan drive circuit is 45KHz - 57KHz range."

The only idea I could muster would be to attach an in-line antenna filter to eliminate the passing of that frequency range. I'm not up on the physics or electronics enough to know if that would be detrimental in some way, or even possible. Or if such a thing even exists!

The monitor tech thought it was a good concept, but I thought I would get opinions from those that use and repair ham radios.

Any ideas on this or other suggestions? Or am I just going to have to move to an LCD monitor (or will that even make a difference?)

73, Frank K2NCC

Get Timewave's ANC-4. It's designed precisely for your problem. It's
also effective for powerline noise, pulse noise, etc. It uses a phase
inversion and summing process at input RF fq.

7410. Re: [TS-520_820_530_830] CW Filter?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-28 14:57:47 UTC
From: bob54quam@cs.com
Topic: 7407 Message: 7410

Frank,
On my TS-520S, the cw filter is automatically activated in the cw mode. There is no provision to switch off the filter. In the TS520SE, the heater switch is replaced with a cw filter switch, so it can be operated with the filter switched off.
I believe the 520 is the same as the 520S; switch to cw mode and see if you can hear a difference; it should be substantial.

Hi, I sent an email to Kenwood USA. My question was about the TS-830S. I wanted to know when was the Kenwood TS-830S manufactured. Here is the reply I just received.

Bob N3DOK

Dear Kenwood Customer:

The TS-830S has been out of production for 25 years, they were made from about 1979 - 1981.

Kenwood no longer services the vintage TS-830S due to age and available parts.

If you need further assistance, please e-mail us again.

Sincerely,

Kenwood Amateur Radio Customer Support

Topic: 7407 Message: 7412

Not sure you can. I guess if you had a good ear you could tune a signal and listen to it's drop off as you tune away from it's strongest point. Popping off the top case/cover, looking and putting the case back on requires nothing more than a phillips screw driver and maybe ten minutes of your time. You can even leave the rig on it's feet to do it. Nothing to fear.

Best regards,

-Sean

The change should be very obvious to anyone when switching in a CW filter,
as they are much narrower than the SSB filter.

Bob,

That's strange - I was sure it was in production later than that.

Incidentally, the technical review of the TS-830 in the RSGB "Radio Communication" magazine was dated July 1982..... Such reviews are always of current equipment, usually soon after introduction.

Maybe Kenwood meant the TS820.

Bob
That is surprising coming from Kenwood, because it is incorrect. The TS-830 first appeared in ads in 1981 and was still advertised in 1987 This would indicate the years of manufacture were 1981-1986 or possibly early 1987. Incidently, The dates for the TS-520S were 1979-1981.

7419. TS-830 NB switch modification

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-28 16:35:41 UTC
From: Joan de vk5kyo
Topic: 7141 Message: 7419

Hello Group

I am not familiar with all the modifications for the TS-830S, and I am hoping one of you can help me with this one.
I had just completed a basic aligningment of the set, when I noticed the NB switch was on. After I turned the NB to the off position, I stumbled across a problem. I later discovered that changing bands, the digital display went dead, but only when 1.8, 18, and 28.0 MHz position is selected, other bands are ok, even 28.5 when pressed the +0.5 button.
I followed the NB switch wires and it appears to break the R62 (pin 2 of plug C) lead on the PLL board. For normal operation, with the mod in place, the NB switch must be in the on position all the time
Got any clues, anyone?
I could easily remove the mod, but it would be nice to find out why it was put there in the first place. It could be a handy feature, but I have my doubt.
Thanks for your help

Joan VK5kyo

Well, two issues that come to mind.

First, the monitor is generating frequencies between 45KHz and 57KHz.
The ANC-4 has an operational range between 500 kHz to 80 MHz.
Wouldn't that make it useless for this specific noise? Or, am I
missing something?

Lastly, for the cost of one of these, even used, I can buy a quiet
monitor that I won't have to adjust every time I move around on the
bands. Granted, the monitor won't be as portable, but I'd only
anticipate use of it at my base station anyway.

I think I'm just going to go down to Best Buy (etc.) and take may AM
radio with me to find a quiet monitor.

From: Kevin der Kinderen
Topic: 7408 Message: 7422

Not all LCD/flat screens are quiet. I had an LCD screen with a brick style power supply - similar to a laptop power supply. That thing drove my receiver nuts. I eventually hooked the monitor to my 12 volt power supply and eliminated that noise. Recently I purchased an LCD monitor from WalMart. It's a Sony 17" and had a $150 rebate. Not sure if they still have the deal, but this monitor is quite. WARNING: I've read in the RFI list that Sony monitors are bad for generating RFI. Maybe I got lucky.

Try changing the scan rate on your monitor card and see if that reduces or moves the noise out of the way.

There used to be a product that was like a sun screen for the front of the monitor. This particular product had a fine metal mesh in it which provided shielding. The disadvantage is that it reduced the clearness of the picture and the angle of viewing. I did a short search on the Internet and found some high-end products like this, but maybe a deeper search will produce something inexpensive and worth trying.

The LCD monitor, if it doesn't generate RFI, may be the easiest route to take.

The TS-180 came out in 1979 and was all solid state. This was about the time
the TS-120 came out, also solid state.
The TS-520SE came out about then and
continued untill 1981, when the TS-830 came out, followed soon by the TS-530,
replacing the TS-180. Shortly thereafter the TS 930 and TS-430 came out and
were made concurrently with the TS-830 and the TS-530
My guess is that the TS-180 wasn't very popular, so Kenwood produced two more
with tube finals; the 830, and 530.

Pete, Steve and Charles (by email)

Thanks for your helpful comments. You've all suggested a bad/dry joint as the likely cause, so I'm trying to track it down. No luck so far, I've now tightened just about every screw I can find on the cicuit boards. Also I have checked my ATUs and other connections between the rig and the antenna- no problems found.

I'm back to thinking it must be in the antenna or feeder. So next job is to replace the feeder. That should keep me busy over the holiday weekend here in UK...

73
Dave

Dave,
I noticed exactly the same on my recently acquired TS830S-
broadcast stations appearing in the ham bands.
However when the RF attenuator button was operated a few times the problem went away-at least temporarily.
I attributed the cause as being rectification of strong signals caused by oxidised contacts in the switch. Certainly its cured....for now.

regards,

Steve G8LIK

Switch the radio to 20 meters in USB postion. Tune in
a SSB station. Now switch to CW postion. It will be
hard to tune in the SSB station or not at all if you
have a 500 Hz filter installed.

Dave,
Just to clarify-in the case of my rig the only issue was of
oxidised contacts in the RX attenuator switch which can be cleared at
least temporarily by operating the attenuator button a few times.See
if that clears it before delving too deep.

cheers,

Steve

Hi folks

I'm looking for the remote plug (8P octal plug). Does anybody sell1 or 2 piece of this? Let me
know.

Daniel, HB9DDS

TS-820, Fix the problem with the display:

1. Remove the counter assembly unit from the 820.

2. Remove both circuit boards from the counter assembly (upper and lower boards.)

3. Scrape away the varnish from the corners of the boards where the interconnecting screwes and spacers hold the boards into the case.

4. Reassemble the counter.

SOURCE: http://www.radiomods.co.nz/kenwood/kenwoodts820.html

"Simply open up the top of the radio, pull the flat white plug that runs from the display to the electronics. Clean the pins with an emory cloth and apply a light coating of No-Ox (anti-oxidation compound) and put it back together."

That's good in theory - but that didn't fix my problem.

If anyone wants to see what the counter assembly looks like when
fully disassembled I put some pics here.

http://frrl.dyndns.org/frrlnetannex/ClassicRadios_Picts/

in the Kenwood_TS820-S folder

Mine still does not work and the particular problem I have is heat
related - keep the unit cool and it works - otherwise - too bad.

In the olden days in the Navy, when we had heating problems we'd fire up the equipment and wait for it to fail. Then take out our can of freon and zap each part. After a zap, if the equipment worked, we'd replace that part. Worked almost flawlessly.

I guess freon is not easy to come by now but there must be some substitute.

73 & good luck,

M.G Chemicals make a Circuit Cooler product called SUPER COLD that is used for troubleshooting heat related problems. You can get a 10 oz spray can for around $8.00.

7437. TS-520S Blowing Fuse

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-04-30 05:09:40 UTC
From: James D Harrison
Topic: 7437 Message: 7437

Hi,

I am new to the group, and have bought a used TS-520S, that looks as close to new as I have seen from another ham. I have the problem though that the 6amp fuse blows.

Looking through past threads, I think it is a tube problem.

I can power it up with the heaters, and grid turned off, and it runs in receive for hours, and has a great receive.

On the other side, I turn the grid and heaters on, wait a little while and start to follow the manual to tune up into a cantenna on 20mtr.(I also opperate a SB-102, and SB-110A tube tune up is not the problem), and the lights in the meter flicker a little, then it is dead.

Replace the fuse after the rig has cooled down (had to drive to town to get one, as I was fresh out of 6amp) and turn it back on it works fine. After letting the heaters on for 15 - 20minutes, the meter lights flickered (this time did not try to transmit) and out it goes again.

Does this sound like something shorting in one of the tubes after warming up?

Or does it sound like another problem?

The tubes installed are Philips ECG 6146B, and seem to be new, but were well shook during transit across the US, as I found they were part way out of there socket, while looking for the reason for the first fuse to blow. I also have the original tubes, but only have 60%. From my tube collection I have a set of 6146W that I cam install should the Pillips be bad.

I sent the Philips with a co-worker (fellow ham) home to test on his tube tester, and asked that they be let to warm a good long time first to see if they show a short when heated up. Hope to find out in the morning sometime the status on the tubes.

Thanks for any input!

73 James KG4PBI

James,
I experienced this too with a TS830S shipped to me after
purchase.
Even if the tubes check OK on a tester with 900V or applied
probably a different story.
My meter lights flickered 30 seconds into putting out the first cq
call,a smell of burning and the 4Amp mains fuse blew.(Have since
replaced that with 3A here on the UK 230V mains for added
protection).
I changed the original(!)Japanese tubes to GE6146B and all fine
since. You just have to remember to go though the neutralising
procedure and reset the bias to 60ma too.
Might be worth checking that the cathode resistors on the final PCB
have not overheated as a result of the fault.In my case they looked
and measured OK. Total resistance I recall is 5 ohms with them
paralleled up.
The problem with old tubes is they don't like vibration/being banged
around in transit and the shipping you experienced almost certainly
finished them off.
Good luck,

73's,

Steve G8LIK

Gordon:

The next question is how much smoke for how long. If a diode or capacitor is shorted, the transformer will smoke but is not always ruined.

First thing to do is install a 100 watt light bulb in series with the mains side of the 120V line as described below.

Unplug the rig any time you touch a transformer connection!

Disconnect the following in this order. Each time you disconnect a wire, plug the rig in and turn it on. Observe the light bulb. If it is almost full brightness, you still have a short. If it glows dim, the short was in the circuit you last disconnected.

Disconnect the wires from the following transformer connections in this order Leave them disconnected and then try the next one.
1. 800
2. 13
3. 300
4. 230
5. 90

Also, if you have the optional DC power supply mounted on the back, it should be completely disconnected.
Let me know your results. If the transformer is good in spite of smoke, we can help you find the short that caused it to smoke.

Now, the light bulb instructions:

Save your power transformer !

Place a 100 watt light bulb in series with the AC mains (120V line in the US) going into the rig.
The bulb will glow bright if there is a short but get dimmer if the short is cleared.
This keeps you from frying a good transformer while troubleshooting or going through 30,000 fuses.

I usually purchase a short orange extension cord and one of those rubber Edison base (light bulb)sockets that are rubber coated and have a white and black wire coming from it. These are used as temporary wiring at construction sites. Ace Hardware and most building supply stores have these. The cost of these two parts won't total more than $5.00 with some creative shopping.

Open the orange jacket at a point a few feet from the female plug to expose the White, Green, and black wire. Cut the black wire only.

Connect the black wire from the Edison socket to the black wire that leads
to the male end.
Connect the white wire from the Edison socket to the black wire that leads
to the female end.
I usually use a 100 watt bulb. This limits the AC current to below 1.2 amps.

Use this for testing or burning in a rig that has been in storage. Also
useful when first trying a set of 6JS6 or 6146 tubes in the event that they
are shorted. Use this when trouble shooting any problem that causes blown
fuses such as shorted rectifier diodes or capacitors.

With a rig that has a short across the transformer secondary, a possible
shorted diode or capacitor or shorted tube, the potential for frying the
transformer while troubleshooting is great. I have seen many rigs damaged
needlessly this way. If the bulb glows bright, there is a short. If
it is dim, there is no short.
The bulb will limit the current and keep from frying the transformer.

Do not operate with this. This is for testing only.

Please protect your rigs transformer.

Thanks Walt,
I disconnected ALL the wires from the Transformer except for the
Primary and turned it on. It has NO DC to DC convertor.
Yep, Still smoke and all the voltages are really low except for the
800 Volt pair. It takes about 2 or 3 minutes before the smoke appears.
The 13 volt only measures about 11,the 300 volt only measures 156,
the 230 measures about 150 and the 90 measures around 76 volts. the
Input is right at 120 volts..
I'll make the light bulb deal, as that is a good idea.
I found a used transformer last night from a guy for $25.00 so I
should have it shipped here by the end of the week.

Thanks for the tips.

Topic: 7205 Message: 7445

Hi,
I`ve been sitting on a TS-520 since 1988 and only used it once (2004 ARRL FIELD DAY event). I am the second owner and have original sales receipt. Also have the operating manual for it. Still has original "extra parts" that came boxed up with the radio (feet extensions, vfo plugs, fuses, white plastic screw driver thingy, etc, etc).
I also have the VFO-520, with manuals and original shipping box. Both (radio & VFO)are in great shape. I have no need or use of these items. I hate to let them go because I`ve had them for so long. Never had a chance to work them because of my living situation (apartments). I have a FT-857 and I dought that I will ever use the the TS-520. I have turned them on about weekly (before I got my FT) to monitor the frequencies.
Thought I would drop a line to you all before I ebay them off. The shipping prices would scare me off. So if you live in the Des Moines, IA area, give me shout. I`m guessing $250 for the radio and $50 for the vfo, is that about right?
73`s. Kyle N0MKH

Hi Steve,

I have changed the tubes out with a pair of GE6146W (6146B from date code), and reset the bias voltage, and seems to be runing for over an hour without a problem.

I have the manual, but seem to be having problems neutralising the unit. My cantenna has a port for attaching a VTVM to read DC voltage, and I am not getting any readings (don't own a RF VTVM yet). With the option 2, adjusting for lowest S-meter reading on another receiver, I seem to be getting the same S-meter reading on my TS-2000 no mater where I turn the cap to.

I don't think they are right as is, so I need to find a local Elmer with either the proper tools, or better experiance in this. I own a few vintage rigs, and as luck has it this is my first final change out.

Currently if I key just very short and say something I get a nice trapizoid on my Heathkit SB-610 scope, but now the ALC goes to full scale after I unkey, and takes a very long time to return to receive. I assume this is because the neutralising is not correct yet. So I cut the rig off not to cause any damage,until I can get it done right.

James,
I have also had problems neutralising two rigs, a 520SE and the
830S.
I used an adjacent transceiver to monitor for a reduction in S meter
reading whilst the rig under test was connected into antenna.
However it seemd that pickup from RF radiated from the mains lead
was
greater than the actual wanted signal making any 'dip' very small
and
I toyed with connecting the rigs directly together via an attenuator
(with the screen switch off of course) to get a better adjustment,
but
eventually managed without.
Another approach might be to check that max output and plate dip
coincide when using the tune position and if not tweak the neuting
capacitor accordingly. As the screen volts is reduced
in that state there is less chance of the tubes dangerously
oscillating.That should get you in the parish? If you can get that
close you can then confirm its acceptable in the tune position.Any
comments anyone?
Good luck!

Steve

Steve, James.

I did mine with this method. Easiest if you hook up a wattmeter between the rig and the dummy load. In the tune position with meter switch in ALC, peak the meter like normal. Then switch meter to IP. Now while in send mode watch both the rig's meter and the wattmeter at the same time. When you dip the plate you will get max reading on the wattmeter. The wattmeter peak and the IP dip should happen at the same spot on the plate knob. If it doesn't, take the rig out of send mode and adjust the neutralization cap and try again. Worked really well for me and took about a minute or so to find the right spot on the cap.

From: Bob Cunnings
Topic: 6800 Message: 7449

Hi Charles,

Well, I got the job done, the trick was to go slow and not drop the little ball bearings and springs and like you said to document how things fit together before taking them apart. It *is* a little tricky getting the vfo out.

Yes, the grease was hard and the main shaft bearings somewhat frozen up - it seemed the big nut holding the bearings had been over-tightened as well. So the geartrain came apart for cleaning and relubing with sewing machine oil. It was the devil to get it all back together while maintaining anti-backlash tension in the two big gears but once done the result was very nice, smooth as silk, as good as new.

Also looks better with the knobs and panel cleaned up.

Thanks again,

Bob NW8L

David,
That sounds a real good method! I shall try that next time
round!

73's,
Steve

hallo bob
Charles returning
pleased you managed to get everything sorted
its well worth it in the end personally I don't like using grease for that
simple reason after awhile it cakes like 25 years (hi hi) this is the
reason that I advised using light sewing machine oil just a drop in the
right places is enough it will permeate through the gears and the pre
loaded gears where it will hold tension for back lash much better than
grease oil will penetrate grease wont
I forgot to mention about that large nut/ thumb nut thumb tight only
thanks for the e-mail its most rewarding knowing that I have been able to
help some one to get rid of that lumpy vfo gear / train sorted and to run
like a piece of silk again I bet the whole front panel loved its birth
day with a good clean surprising how fowled up they get best of luck

Go to 6.9 on page 40 of your manual. Set it up as described in the book. With the SG switch off can you see signal on your scope with it between the rig and the dummy load? If so, you can use this as an output indication.

You can also use one of those cheap CB SWR meters. After tuning up and switching the SG switch off, insert the SWR meter in line with the dummy load. Place it on forward power and turn the set knob all the way up or as high as needed to get an indication. As you get closer to the null, you can keep increasing the set knob on the SWR meter as needed.

What are you using for an adjustment tool? The cover has to be on the final cage when adjusting this capacitor. Unless the tool has a plastic blade, it will change the setting when touching the capacitor. Also be very careful as there is high voltage on this capacitor.

I usually find that the turning of this capacitor is so stiff that it causes the insulated tool to break.

What I do is to use a metal screwdriver with a good plastic insulated (not wood) handle. I shrink 2 pieces of shrink tubing, (double thickness) on the screwdriver shaft so it will not touch the edges of the hole in the cover. Holding the screwdriver by the plastic handle, I nudge the capacitor a bit at a time and remove it to look at the scope or meter. I nudge it one way or the other until I find the minimum point. The screwdriver must be removed each time the signal level is checked. Remember, the screwdriver shaft will have high voltage on it any time it is in contact with the capacitor. Once you get near the null, the adjustment will be very touchy. Once I get close, to get it right on, I have to nudge the capacitor ever so barely.

You are far better off to use an insulated tool if you can

There is also another way to determine neutralization.
Leave the SG switch on.
When properly neutralized on 28.5,the output power to a watt meter will PEAK at exactly the same point at the DIP in IC current occurs when tuning the tune control.

If it is exact, the DEcrease in output on the watt meter will be symmetrical as you barely tune out of the dip on either side of the dip. Once set, this condition will not necessarily occur on any frequency except the one that you adjusted it on (28.5). Also, this is so critical that probably if you check this on 28.5 a few days later, it will not stay exact, but will stay close and that is good enough.

You can do this in the tune mode until you get the capacitor in the ball park, and then retune in CW and make very fine adjustments to the capacitor. Un key the rig when making capacitor adjustments. Barely nudge the capacitor

and then key back up to observe the results. Remember, there is still high voltage while on receive so the above precautions with the screwdriver still apply.

Also, if your idle current is not set to 60 ma, it can cause the tubes to take off.

Go to 80 meters where the rig is not as likely to take off. With the SG switch on. Key the rig on USB with the mike gain fully Down. Adjust the idle current for 60 ma. This is a little over half way between .1 and 0 on the bottom scale when the meter is in the IC position. 60 Ma is .06 amps not .6 amps. It is less than .1 amps.

You can actually adjust the neutralization on 20 meters to get it in the ball park, and then go to 28.5 to finish the process.

Perhaps the above will be helpful.

You also might look into a VFO 120. It's smaller, cheaper and works with
your 830 just like the VFO 240.

I thought they were Chinese, based on the name, but I saw somewhere on the net that they are Yugoslavian. I don't know which is correct (if either.)

I tell you Walt,

You are a veritable font of info! I don't have this transformer problem, and I even printed this out, because it's a very useful piece of general info to know. Many thanks for your info.

73,
ellen - AF9J

P.S. - I finally got well enough to deal with my TS-820 drift issue. Sure enough, VR4 was off. It read 9.12V, instead of 9,0V. I've readjusted it, and I've installed th new 6146Ws I got. I just need to neutralize them. There are 2 different methods described; one in the instruction manual, and the other described in the service manual. The instruction manual method looks a little easier to do. BUT, it's a little sparse on detail. I just says do it at 21.3 MHz. No mentionis made of which mode to use (I assume CW, since it has a carrier). No mention is made as to whether or not you have to tune the 820 (Drive, Plate, Load, blah, blah, blah). Also, I don't have an RF voltmeter or an O-scope, for getting the null you need for neutralization. But I DO have a QRP wattmeter that will read down 100mW full scale (with 1 mW increments), would this be sensitive enough for neutralization?

7461. TS-520S - IF Frequency ??

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-01 17:33:08 UTC
From: n3hkn
Topic: 7461 Message: 7461

Can anyone verify that the IF frequency, where the xtal filter operates, is 3395khz??

My hope is to pick off this signal prior to the xtal filter. Then feed it to a Software Defined Receiver (SDR). Use the DSP program to create a wide range of free filters, noise reduction, and impulse noise limiting. I would retain the "first half" of the 520 which gives me band-switching. front-end preselector, a nice VFO, and of course transmitting. Transmitting should not be affected since I am not interrupting the signal path.

Dick N3HKN

Just a note to say that the problem is solved- it was a broken wire
in the 450 ohm feeder line. Not easy to see with the plastic
coating! So, in the end the TS-830 was not the problem. But at
least I got to check and tighten all those ground connections...

Thanks for the help from this group.

If you follow the manual instructions, you can't go wrong. There's nothing conflicting there.

Topic: 7452 Message: 7465

Hi,

Thanks for everyone's help!

I now have it taken care of. I first tried with my scope, however the Heathkit SB-610 does not read such a low RF input the way it is built. The low priced CB SWR meter from Radioshack did not either.

I did pull out my 1978 Handbook, and put together a RF probe to use with my Heathkit VTVM from scrap box parts. It worked! I could use the zero adjust to bring up the scale, and then turn the CAP to the point with the lowest voltage reading.

Under full power the scope looks ok, just need to get on the air, and see how the repots are.

Next hamfest I will have to pick up an other set of tubes for back up again.

The Phillips 6146B that were in the rig when the fuses were blowing, as well as the original 2001 tubes checked out fine running long term on a tune tester, the driver however would go to a dead short after about 20minutes on the tube tester. If a short in the driver is enough to blow the fuse, I may have found the quilty item.

Just need to find a matching speaker and VFO down the road, and as funds become avalible to complete the station.

Thanks again for everyone's input.

James KG4PBI

Topic: 20 Message: 7466

Hello:
I just joined this fine group a few days ago and had
posted a message regarding my 530's low voltage & low
output. I cant remember who gave me the part # for the
HV caps but want to thank you very much. I replaced
both caps,lubed the fan cleaned and Deoxit
treated All the switches and pots etc.The old girl is
as good as new again. Full output on all bands and
great audio reports.
Thanks George K0GWD

7467. TS-830 slow fan?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-03 13:16:10 UTC
From: alpyke
Topic: 7467 Message: 7467

Can anyone indicate if the fan on the TS-830, which cools the finals stage, should be running at just small drift of air? It looks like the fins are spinning, but I can barely feel an airflow coming from it. Is it normal? I'm used to the fans you would see in a PC power supply that you can dry your hair with. Maybe it is normal here though.

Thanks for any help. - Adrian, KB1NFW

7468. Re: TS-830 no ALC in Tuning

From: alpyke
Topic: 7302 Message: 7468

Hi Ellen:

Just wanted to let you know, I finally did replace the 12BY7A tube last night, and that seems to have fixed the problem. I got it tuned up and was able to make my first contact. What a thrill!

There is still something wrong with the ALC METER, or circuit, because there is still no ALC displayed, but by monitoring output power into the dummy load, I was able to peak RF output at about 80 W. When I get some time, I may look into that later, but for now it works.

Thanks again and 73 - Adrian, KB1NFW

Adrian,

You may have to try another 12BY7As. Don't know why but I've found that they all don't work well and sometimes you have to go through several to find a good one.

I have run into that also. Toshiba seems to work best. I had a YO-100 scope
and I take a Toshiba out of it for my 820 and replace it with the new one.

Hi,
In a current issue of ER Electric Radio magazine,is an ad for a Digital Display. The manual indicates it will work with Kenwood TS-520 . TS-511 . TS-900.
Contact them to see if it will work with your 520SE.

The Model DD-103 Universal Digital Dial provides accurate digital frequency readout for vintage receivers and transmitters. It has the offsets for many receivers and transmitters stored in permanent memory so it only requires the VFO signal. It is a direct plug-in with all Collins that have a VFO output. A TCXO provides 10Hz accuracy and .5ppm stability. Available as a kit or fully assembled and tested.

http://www.electronicspecialtyproducts.com/

I have no connection to this company. Passing this information along for anyone who might be interested.

7479. Re: TS-830 Sidetone

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-04 22:04:07 UTC
From: belbert2002
Topic: 5888 Message: 7479

This discussion relates to a problem/question I have regarding the CW sidetone pitch and the CW offset, which should be the same so I can easily zero beat the station I'm working. My problem is that the side tone is 700 Hz, which I like, but the offset is 800 Hz, which for me (like for Mike, AL2P) is too high. I have tried to lower the offset to 700 Hz by adjusting L4 on the VFO (per the SM) but it appears to shift the VFO frequency as well. As a result, the offset remains at 800 Hz. Am I doing something wrong?

Thanks. 73, Bruce K6ZB

Topic: 5888 Message: 7480

Changing C-4 and C-5 on the AF unit will lower the sidetone that you hear while you are transmitting. I think that you are already happy with it.

First of all, be sure that you have L4 back where it was. Now try adjusting VR3 in the PLL unit. Mark it with a felt tip marker so you can get it back where it was if you do not like the results or if I am wrong. I think VR3 will shift the CW carrier point on transmit. That will allow you to put your transmit in the right place when you tune the received CW signal for the desired pitch.

From: Ellen R
Topic: 7302 Message: 7481

No Problem Adrian. :) I remember when it happend to me for the first time, back in 1986. It completely threw me for a loop.

All I have left to do with my TS-820, is neutralize the finals. I haven't had the time to do it, but I ahve spent some time burning in the finals (at the suggestion of a friend of mine who used to be an RF tech for defense contractors out in California before Glaucoma made her eyesight too bad to do that kind of work [her vision is over 20/250, and she is legally blind]). I'm also waiting for a heavy duty, insulated RF adjustment tool to come in the mail from the same ex-RF Tech friend. The hopefully, thigs will be good to go with my TS-820.

73,
Ellen - AF9J

P.S. - I used to operate a TS-830S at the Univ. of WI ahm club in the 80s. It's a good rig.

Try http://www.buxcomm.com/ under replacement mic's.

I'd bought several items from there with no problems.

Why not just set the receive RIT off by 100 cycles and leave it there whenever doing CW. A semi permanent mark on the RIT knob would let you get back to the 100 cycles 'offset' anytime.
Peter VE2FAR

belbert2002 <k6zb@arrl.net> wrote: This discussion relates to a problem/question I have regarding the CW
sidetone pitch and the CW offset, which should be the same so I can
easily zero beat the station I'm working. My problem is that the side
tone is 700 Hz, which I like, but the offset is 800 Hz, which for me
(like for Mike, AL2P) is too high. I have tried to lower the offset
to 700 Hz by adjusting L4 on the VFO (per the SM) but it appears to
shift the VFO frequency as well. As a result, the offset remains at
800 Hz. Am I doing something wrong?

From: qrper723
Topic: 7488 Message: 7488

Hi all,

my TS830V(Japanese Version) has problem of RIT operation.
It works and does not work intermittently.
Have to replace the potentio meter and varactor diode or any other
parts?

Any suggestions?

ja9mat hidehiko

7489. Thinking of Selling/Trading my 830 Equipment

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-06 03:28:46 UTC
From: Kevin der Kinderen
Topic: 7489 Message: 7489

Hi Guys and Gals.

I recently purchased an FT1K and living in an apartment I need to keep things trimmed down a bit. So I plan to package up my 830 station and sell or **preferably** trade. I figured I would mention it here first before hitting the classifieds.

I would like to let it go as a whole package if possible. It will take me some time to package everything up properly so I won't ask for payment or trade until I'm ready to ship. Be patient, getting to the post office is difficult for me.

Let's get this out of the way right up front... I smoke. I'm not the original owner of the equipment and I cannot say whether the previous owners smoked also. The lettering on the first TS-830S looks clean and white to me.

TS-830S with CW filter in very good shape both visually and on the air. I have used it for CW, SSB and digital with fine reports all around. Reports of SSB audio with the MC-50 were always great. There are no mods on this equipment.

TS-830S - I just picked up this unit. I'm told that transmit and receive work fine but the display doesn't work. I just opened up the box to have a look at it. It's got rust marks on the case and the front doesn't look anywhere as nice as the TS-830 above. It seems this one got a lot of use and may have been in storage for a while. From the previous owner's description, repair should be pretty easy.

SP-230 - Works and looks real good.

VFO-230 - Works great. I never had reports of drifting on PSK-31, I think that's a good testament of its stability. I believe there is supposed to be a ring around the VFO knob but there isn't one there. Also, the interconnect cable to the TS-830 has one of the connectors heavily taped with electrical tape. It has never caused a problem. Remember the trick about resetting the VFO. This caught me the first time.

AT-230 - Works and looks great. I've had it open and it's clean inside and no evidence of any arcing.

SM-220 with BS-8 pan adapter - works and looks fantastic. This really makes the TS-830S system a joy to use.

SM-220 with BS-8 pan adapter - mostly working, looks OK. The pan adapter has a broken core in one of the coils. This causes low signal display in panoramic mode. I tried to order a replacement part from Kenwood but they no longer stock them. I can't believe this would be a hard part to find. I kept

it in case I needed spare parts.

MC-50 - works and looks real good.

MC-50 - some small chips in the paint, slight discoloration of the mouth piece (black part). I have not used this mic so I don't know how well it works. It came with the second TS-830S. The wear on it seems consistent with the second 830.

Spare tubes, no idea of their condition. They came with the second TS-830S:

1 - 12BY7 "Realistic Lifetime" has a Radio Shack price tag of $4.99
1 - GE GL-6146
3 - GE 6146B/8229A
1 - RCA 6146B/8229A
1 - Matsushita 2001A (6146??? - not sure what this is)

Various manuals (some original, some copies) and whatever cables I have for equipment interconnection.

That's the list. I can get much more detailed and and will try to answer any questions you have.

Check my call (K4VD) on QRZ.com for a picture of the station layout.

I've not settled on a price yet. Maybe you guys can tell me if $1500 for the package is unreasonable. However, I would prefer a trade. My current needs (actually wants) are a late model linear amp to cover at least 80/40/20/15/10, a rotor that can handle a Mosley CL33 (not very big), INRAD filters for the FT1K, Yaesu SP-8, Yaesu MD200 or MD100. Will consider almost anything.

I'll keep it here about a week - longer if there is some interest and then move over to eham.net and qth.com.

73,
Kevin - K4VD

Looking at the options and considering the analog nature of this fine rig, I have to agree with Pierre and just use the RIT for the desired CW offset. Thanks and 73, Bruce K6ZB

7491. Small Rubber Feet for 830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-06 15:18:40 UTC
From: belbert2002
Topic: 7491 Message: 7491

Does anyone know of a source for the rubber feet on the side of the 830S? The one listed for this group does not stock them. Thanks and 73, Bruce K6ZB

7492. WTB: VFO-520/SP-520

Yahoo group: TS-520_820_530_830 (2006)

Topic: 7492 Message: 7492

Hi,

I am looking for a VFO, and speaker to complete my TS-520S station, if anyone has some extras that are not needed, please contact me off group.

thanks James KG4PBI (stg57 at yahoo.com)

7493. Suitable 'outboard' AF filtering ideas...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-06 18:46:12 UTC
From: Roberto Baca Barnard
Topic: 5888 Message: 7493

My TS820 does not have the CW filter installed. Eventually may get
part or equivalent replacement...
I am interested in an 'outboard' AF level filter that I could build,
easily, myself. Anyone have a manageable design or reference to one?
Something I could plug the headphones into, a notch/XTAL or equiv. And
one that is self-contained (i.e. don't wanna run audio through
ProTools on the Mac).

Tnx
RBB WB7AVF

7494. V F O trio/kenwood ts820

Hi Rob,

I hope you found my little explanation of why we neutralize new finals to be informative. I may be able to help you on the audio filter issue. Idiom Press markets a SCAF (switced capacitance audio filter) kit, for $90. Here's the URL to view more info on it:

http://www.idiompress.com/scaf-1.html

I had a couple of rigs (an Index Labs QRP Plus, and an SGC, SG-2020) that used SCAFs. They work pretty good, but you do have to live with the fact that very strong adjacent signals will cause the receiver's AGC to pump, and sort of "pinch" the signal. Otherwise, check on e-bay for a used Autek SCAF, or Timewave outboard, AF, DSP.

73,
Ellen - AF9J

Note that the inner ring can be turned separately from the outer knob by holding the outer knob and turning the inner knob. This is to calibrate the outer most dial with the red line.

The inner ring is one or several complete turns out of sequence causing your problem. Rotate the inner ring 360 degrees one way or the other.

See if the problem is better or worse. Continue to make 360 degree rotations of the inner ring in the direction that improves the problem until it is corrected.

Daniel,
Manuals for the TS-520SE and the VFO 520S can be purchased from The Manual Man. He won't be processing orders until after May 28 because of the Dayton Hamfest, but the manuals are available: www.manualman.com
I have purchased a few manuals from him and they are good quality copies.
Hope this helps. Good luck!

I went through this process and can tell you that it's kind of a fun process to see how all these wheels work. I took mine apart to the last wheel. If you do so, when you reassemble, be aware that there are some close tolerances between the 2 spinning wheels. They need to spin independently and if you hear some "grinding" when you spin the vfo the wheels are too close and they are rubbing against each other. On mine, it was a very delicate adjustment and if the dials are any bit warped you might have a problem.

The TS820S (user or service - cant remember) tell you how to align these wheels. There is a special alignmant mark on one of them. But if you have a freq display then you can get the right alignment by trial and error as Walt suggests.

Perhaps "free" was a poor choice of words, but your post didn't really indicate you were looking to buy one...

If I recall you asked if someone had one they could email to you...sorry I misunderstood your request..

There is a service manual both online free and for purchase that explains the difference between a 520S and 520SE...

Yep! Finding an operating manual for a 520SE has always been a problem
even for me. Probably due to the fact the 520SE wasn't around for that
long of a time and Kenwood probably didn't print a lot for separate sale.
Even the service manual, if I remember correctly without running down to
the file room, was just an addendum attached to a 520S service manual.

I've seen a kazillion requests for the TS-520SE INSTRUCTION manual.

I've looked around on the 'net for it and haven't found anything but the service manual, so thought I'd do something about it.

If ya hang on for a week or so, I've purchased one on eBay (my username, for those interested, is eagleeyecomputerinc) and I'll scan it in asap.

Since there's no room here to post files, it'll be in the astaticmicrophones group on Yahoo. I'll post another notice when it's up.

Please stand by.

Topic: 7512 Message: 7512

HI Everybody,

I think I'm finally done working on my TS-820 for now. I've been sick for the past couple of weeks with a sinus infection, and the cluster migraine headaches, and exhaustion that were brought on by the infection. I neutralized my new finals an hour and a half ago (my Oak Hills Research WM2, QRP wattmeter [that reads as low as 1mW], was sensitive enough to give me the null readings I needed), and I just finshed closing it up again, 10 minutes ago (I had to open it up to move an IF board jumper plug, for my now installed 500 Hz CW filter to work properly - oops!).

Now it's time to give it a test drive, and get some of that audio data I promised you guys, I'd get on the Ken's Electronics mic I bought a few weeks ago for it. Once again, thanks to Walt, N9WB, and anybody else who helped me to get this fine rig up and running again.

If anybody would like a sked, let me know.

73,
Ellen - AF9J

Problem solved. I went back through the Notch Adjustment on page 27 of the instruction manual and that put the notch back into service. It's a bit tricky because you can't hear the 1500 Hz hetrodyne from the cal oscillator unless you fiddle with the VBT and IF shift. But, basically, all you do is tweek L10 and VR4 (which is now at the end of travel) on the IF board. 73, Bruce K6ZB

7515. Replacing PD diodes and alignment question..

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-08 13:24:13 UTC
From: Duncan Cameron
Topic: 7515 Message: 7515

Hello all.
I plan on replacing the Product Detector Diodes, on a Kenwood TS-830, with better diodes and wondered if any of you had done this and had also added the 100 ohm resistor suggested in the TS-830 mods handbook? Is it necessary? As far as alignment following the diode replacement; I have a Heath 610 monitor scope, and Simpson Volt/Ohmmeter (I could probably build an RF probe to use with the meter), but wondered if there were another method I could use to complete the alignment.
Any thoughts on the QRO mod for the TS-830? I have seen some comments that it is a really bad idea, and other comments stating that it is an improvement.
Thanks very much!

Hi Daniel

The differences between the 520S and 520SE are outlined on the second page of the 520SE Service manual.
The link below will get you to one on a few sites with the SE Service manual.
http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=9888

I hope this helps.
The other 2 links may be useful too.

http://www.n2ckh.com/TS520SE_DOCS.htm (520SE Instruction manual but looks incomplete)
http://www.eserviceinfo.com/downloadsm/6796/kenwood_TS-520e.html (another 520SE Service manual)

7519. Question about TS-830S diode mod?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-08 16:32:27 UTC
From: N3DOK
Topic: 7519 Message: 7519

Hi, Has anyone done this modification of diode replacement? It is shown on KK5DRs website. Along with other Kenwood TS-830S mods.
Thanks for everyone's help. I had my first TS-830S in 1983. Traded in that one. I missed the sound and performance of the 830. So I have 2 now.
Bob N3DOK

http://www.kk5dr.com/830S.htm
Excessive white-noise, along with peak signal distortions on receive:
This problem is due to the type of diodes used in various sections of the receiver, as well as noise from other sections of the radio. The diodes in the product-detector are of poor quality, and can generate lots of white noise. I used 1N6263 Schottky-barrier diodes for this modification. These diodes should be carefully matched by junction resistance and junction capacitance. Remove the "El-cheapo" 1N60 diodes from the product-detector and install the new ones. The carrier level must be reset after the installation. This is easy to do with the service manual, and an oscilloscope that has a voltage calibrated display. You might ask if this mod is worth the effort, I was able to measure an improvement of about a 40% reduction in noise levels in the receiver. I notice the receiver has a smoother, less harsh sound and reproduction of the signal after the modification. The lowering of the steady background hiss reduces listening fatigue. The picture below shows a set of these diodes installed. Diodes D-20 to 23 are the product detector, on the IF board.

Distortions on peak transmit signal:

This problem is nearly identical to the product-detector. The Balanced-modulator is a mirror image of the product-detector. Kenwood also used cheap noisy 1N60 diodes here. Again, I used 1N6263 diodes, and carefully matched a quad (four-piece) set, and installed them. In this circuit the carrier level must be minimized. Use the service manual and an oscilloscope, adjusting the setting for a null in the displayed waveform. Diodes D-29 to 32 are the balanced-modulator on the opposite side of the IF board.

Noisy diodes in filter switching circuits:

Kenwood selected some rather poor diodes which switch in or out the various filters on the IF board. These cheap diodes can introduce white noise, and distortions on the signal passing through them. It would have been nice to use the
Schottky-barrier diodes here too, but the DC switching currents in the circuit is too high for them, so I used 1N4148 general purpose switching diodes, which are still far better than the diodes originally installed in the circuits.

Hi, To one and all, I have a quest would any of the members have knowlage of where I can get a inexpensive crystal kit that a 14 year old boy can put together and listen to ham radio, I say inexpensive because I can not afford to much but want to send this boy one of these kits in hope that it will drive his cureousity to the point that he will want to know more and get his amateur license. He is also very interested in computers and learning to develope games and other programs I feel this boy has potential and I want to give this boy some drive and encourage him in/on his dreams.

Let me know what is out there for these crystal radio recievers.

God Bless You and Yours

Hello Allan,
Go to eBay. I have seen many varieties of new and vintage crystal kits for bargain prices. Having been in this boy's position, if I was you I might shy away from a crystal kit for "shortwave" listening. The difficulty of working a crystal kit and the lack of freq selectivity might discourage your young friend. That's what happened to me.
My interest in shortwave radio peaked up when I found out about simple regenerative sets. Today you can also buy very inexpensive regenerative receiver kits, hollow- or solid-state, and get 10 fold performance on the shortwave bands with much less difficulty in operation with greatly improved selectivity. You can also find these kits on eBay.

I would also suggest going to AES at the link below:
http://www.tubesandmore.com/
They have a 1-tube regen kit good to 8 Mhz for $22.50 and a 2-tube for $34.50.

Lastly, for an easy-to-assemble solid state kit go to MFJ and look at the 8100 at:
http://www.mfjenterprises.com/products.php?prodid=MFJ-8100K

Good luck building/listening! You and your young friend should have a ball.

73, Lou N2JPR

From: Gordon
Topic: 7527 Message: 7527

My Trio 820S is Now working with the New Transformer. I built the Transformer protector that Walt had mentioned. Works Great and cost less then $10 bucks to build. Thanks Walt!

My question now is this. I have to take the VFO apart and clean the Wiper on it as it jumps around in Freq when tuning around the bands. Do I need to Lube it or just clean it with De Oxit 5 ?
Any Advice ??

Gordon

Ok, Went ahead and Cleaned the Wiper on the Cap. VFO is ROCK solid
Now. I only used the De Oxit 5, no lubricant so If I need to lube it,
I'll have to take it back apart.

Thanks,
Gordon

Hi,

Use the search engine Google. Search for Build Crystal Radio. Found are sites that show you how to build a Crystal Radio from house hold parts. Another one to look for is Build a Foxhole radio. Yes you can purchase a kit. But its fun and educational building a crystal radio using a Oatmeal Box. One great web site is the Xtal Set Society. Here you will find it all!
A) Crystal sets help us to understand the technical history of the 20th century. Three, of many, examples: In very early commercial radio, crystal sets provided inexpensive receivers that allowed a large listening market to develop. During World War II, improved crystal diodes made British and American radar receivers more sensitive than German models. Crystal diode research provided materials and techniques used in the invention of the transistor.

B) Crystal sets provide a step-wise introduction to electronics. Most beginner crystal sets need only an antenna, ground, coil, capacitor, diode or crystal and headphones. Once these few components have been mastered, the student can advance step-by-step by adding a radio-frequency transformer, a one-transistor amplifier and so on until an understanding of most common electronic components is gained.

C) Many modern electronic systems still contain crystal set-like circuits. A few examples: The detector section of AM radios, field strength meters (for measuring antenna performance), broadcast station air diodes (allowing a broadcaster to monitor a small sample of the transmitted signal), radar receiver mixers and instrument devices transferring signals generated at one ground reference voltage to processing circuits having a different ground reference.

D) Challenge and reward: A fourth grader can find satisfaction in successfully completing a simple kit while a subtle semiconductor problem can challenge a senior engineer or physicist.

Ok, Put the New Transformer in, Cleaned the VFO and the Receive part
works GREAT, Even The Digital Display is RIGHT ON frequency... But...
NO transmit. I have NO grid Current (yes the SG switch is on) and NO
plate current. I show about 900 Volts (on the Meter) of Plate Voltage.
So, I replaced the Driver and Both Finals... Still Nothing....
Any suggestions from you Guru's??
Walt... I think I need you..

Allan:
I played around quite a bit with crystal sets as a kid and could not get one to receive short wave. Perhaps I did not know what I was doing 45 years ago or perhaps it was that I lived in Indianapolis near some very high power AM broadcast stations. While it would be fun for him to build a crystal set, all he probably will hear is AM broadcast stations. Since these are quite easy to build from scratch, it still might be a good introductory project.

Ten Tec make a Regenerative 4 band short wave receiver kit that is reasonably priced.. They market them individually or in packs of 5 for classroom use. I don't know how well these will do with SSB.

Here is the link to the info:
http://radio.tentec.com/kits/Receiver

Gordon:

First, look and see if the filaments are lighting in all 3 tubes.
Be sure that nothing is plugged in the CW key jack.
Be in a Amateur band, band position not WWV.

Next with the rig in SSB, mike gain fully DOWN place meter switch to IC and see if you get any IC as you turn the bias control on the back of the rig.

ONLY, If you do see a IC reading do the following:

Set it for 60 ma.with the bias control. (SSB-mike gain down)
Place meter in ALC, switch to CW, carrier control fully up, see if you can get a ALC reading by adjusting the drive control.
Now place the meter back in IC and see if you can see the IC go above 60 ma by adjusting the drive control.

ONLY If you CANNOT get an IC reading in the first step above do the following instead.

With the rig on and in transmit measure the DC voltage at the point labeled SG on the bottom of the final board. It will be around 210 VDC on all modes except tune and about half that on tune.

Now, unplug the rig, let it set for a few minutes and discharge the high voltage.

On the final unit board,

With an ohm meter check R 5 and R 6, they should read 100 ohms each. The Screen voltage goes through these resistors. It is common for these to open due to a bad tube.

Check R 2 and R 3 they should read 5 ohms total. They are 10 ohms each and are in parallel. The tube cathode current flows through these. It is also common for these to open due to a bad tube.

Check L1 and L2. They should read 0 ohms. Screen and control grid bias goes through these choke coils.

Let me Know whether all of this checks out.

If any of the above parts are bad, after replacing them use the light bulb in case of a tube short.

hi Gordon
careful when you get into the vfo
wipers require a good clean de oxit try to keep oil away from the
wipers they work better when dry what oil tends to do is collect dust and
other substances and this creates a build up and loss of contact
use oil on the bearings only one drop ideal oiler is a drug store syringe
and thin sewing machine oil NOT automobile oil too thick just looking
for the merest drop that will be enough whilst you have the vfo out
you might as well clean and lubricate the vfo gear train that is a simple
job but a little tricky document how the dials come of and be care full
of the preloaded spring in-between the main gear wheal which fit back to
back the reason for these gears being back to back with a preloaded is to
stop any play in the vfo dial (in other words it keeps pressure on the
vfo cog) use a digital camera when you disassemble it and mark the
dials in there position and when re assembling set them up with a
frequency counter so that they will run true to your to the frequency
counter or set them up with a near by receiver with a digital display
and zero beat the 820 with the chosen frequency on the receiver
.....its a simple job but work methodically lay everything out as it comes
of the spindle do not take the vfo apart use the cleaner and work the vfo
back and forwards this is usually enough to clean the wipers also those
cotton buds on the end of small sticks soaked in de oxit are handy best
of luck

Check control grid bias and screen grid bias voltages.....you probably have an open resistor in the bias power supply circuitry.....visual inspection most likely will tell you where the problem is...look for a broken or burned & discolored resistor.

Thanks Charles. I have already cleaned the VFO before I got your advice. It looks Like I did it EXACTLY as you described. I did add a drop of sewing machine oil to the bearing when I was in the VFO. I just used the De Oxit on the Wiper. I also took the gears part, cleaned and lubed them. I was VERY careful when I took the Dials off and made sure I got them back Exactly as I took them apart.
Thank you for your post as It is Exactly how to do it.

Now to follow Walts Suggestion, and get it to transmit.
I'll report back later..
73,
Gordon

Ok Walt,
Yes, all three tubes have the Filaments lit. There Is NOTHING in the key jack. I'm in the middle of the 20 meter band (I tried other bands also)
R5, R6 ,R2 and R3 all test fine Both L1 and L2 check fine.
Voltage at the SG terminal in ALL modes EXCEPT tune is about 210 Volts
In tune, It drops to 17 volts. Still No Bias Current and No output at all.
I have to run some errands, but I'll do some more checking when I get back.

The divider resistors for the screen voltage in Tune need to be replaced. This will affect only the tune position. Next you need to check for high voltage on the tube plate caps. Be careful, it is over 800 V. If you are not familiar with measuring voltages this high or if your meter will not go that high, wait and I will get back to you this morning.

You will also need to check the control grid bias. I will help you with that when I have more time this morning.

Hey Walt,

I recently built that Ten Tec Regen (further up the thread - Model 1054 Regenerative 4-Band SWL Receiver) with a bunch of boy scouts. It is a very hot set for the money (keep the headphones off when setting the regen control, a touch too far and your ears are ringing for the remaineder of the day). SWL is excellent and CW is good too. I have had limited success with SSB reception though but it may take a bit more finesse with the regen control.

A year or two ago I built the regen set that is described at http://funwithtubes.com . I did wind my own coils for that project and got the unit perking but need to spend a bit more time with it. There is a picture of it near the top of this page: http://retro-tronics.com/bench.php . FunWithTubes has lots of great projects and excelling instruction, including some great tips on winding your own coils (e.g. the use of double sided-tape over the form).

The Ten Tec kit is nice because it is very portable (runs on two nine volt batteries) and comes with a beautiful front panel and great build/use instructions. I'll try to put a pic up on the retro-tronics.com bench page soon.

I also built, with some cub scouts a few years ago, a fox-hole radio that used a graphite pencil tip and an anodized razor blade as the detector. They actually worked but I would advise against having a bunch of 9 year olds winding their own coils (that meeting was a disaster, I had to rewind all of them myself). Maybe I'll get a picture of one of those up on the site too.

Now, there's that TS-530S I need to talk to you guys about...

Dan Rasmussen

PS I'm new here.

Thanks for replys . I finished up removing the main knob and then
the screws holding the outer knob can be slackened to allow the
inner Hundred didgits to be located correctly .This is best done at
250 and then tightentd and spun from one end to other and very
slight adgustment made . sounds hard but in practice only takes a
few mins . fully tighten and refitt main knob and ensure this turns
freely without rubbing . job done and reads ok 100-500 BOB G8acq
note this is for seperate V F O
Unit

Alan:
There are groups that specialize in crystal sets. One I remember off hand is called "The voice of the crystal" and there are descriptions (and kits) for several sets.
But, remember a simple crystal set will not receive SSB or CW as there is no local oscillator. Pretty well limited to AM signals by the nature of a crystal set.

You are right Walt. R6 measured way too high, instead of 56k it measured almost 700k. Replaced the Dividing resistors and Now I have about 105 Volts on the SG in the Tune Postion.

I measured the High Voltage right at the plate caps it shows around 800 volts on each of the finals.

While you wait for the kit, you might try knocking this thing I found the other day together:

http://vintageradio.me.uk/electronics/take_twenty/noise_limiter.jpg

Apparently there was a british series of cheap electronic projects in the 60's that has been scanned and posted. Had to take less than 20 components; less than 1 pound in the 60's. I certainly won't say that this noise limiter will compete with the kit you're looking at, but even I have the stuff in my junkbox to do this...once I find the other site that can translate british components again. What is a bc109 transistor on this side of the pond?

First I should probably swap out my finals and neutralize them. One needs audio before one can filter it.

From: belbert2002
Topic: 7520 Message: 7546

Looking at what's generally available in 500 Hz CW 455 kHz IF filters from Kenwood, I'm finding that the YG-455C-1 can be found at eBay and at QTH.com, etc. This was made available for rigs after the 830S and presumable has a different physical (and electrical?) interface. I wonder if anyone knows if this filter will work with the 830S and what's involved with installing it.

I'm still interested in obtaining the original equipment YG-455 C filter, if any one would care to part with it.

Thanks and 73, Bruce K6ZB

Walt and group,
New problem showed up Toady. The Light Bulb Glows very dim when I turn the rig on then stops glowing all together.Rig receives just GREAT. All is well. Then, When I turn the Heater switch on, The light starts to get bright, then dims way down. Within a minute, the bulb starts to get brighter and brighter and even after I turn the Heater switch OFF, it starts to glow Really Bright. I have to Shut the rig off to get the bulb to go out.
If I leave the heater switch off after I have turned on the radio, The Radio Receives fine. This problem only starts After The Heater switch is turned on. So, I thought maybe a bad tube, so I replaced the Driver and Both 6146B's and Same Result. Suggestions ???

Maybe I should just make this TS-820S a Receiver ?? :-)
Thanks for all the Help Guys! Especially Walt!!

Take the three tubes out, and then turn on the heater switch, and see if
it does the same thing.

Thanks Pete,
I found That problem. Seems there were some intermitent connections
inside the 3 , 10 pin connectors that are at the TOP of the RF board.
Got in there and replaced some bad terminals (connector side) and
that Problem is now Gone. The light bulb glows dim again.

Now, I just need to get some bias current and see what goes. I still
show 0 on the IP current when I am looking for the 60 Ma idle current.
Thanks for the suggestion !

Topic: 7550 Message: 7550

Hi Again Everybody,

No, I don't have another problem with my TS-820. LOL The little historian inside of me is wondering how old my cool TS-820 is. I briefly looked on the back panel, but I can't find a serial number (although it could be concealed by the bottom connectors. Does anybody know how to date the TS-820 (or any of the other hybrids for that matter)? Is there a serial number, and if so what is the numbering scheme? All I have to go off of so far, is the front panel, which literally says "Kenwood TS-820", which I think indicates that it's an earlier one (I think all of the later ones automatically came with the digital display [which mine doesn't have], and were badeged "Kenwood TS-820S]). Can somebody enlighten me on this?

73,
Ellen - AF9J

P.S. - anybody interested in skedding, so I can get more audio data (for the group) on the mic I got from Ken's Electronics?

P.P.S. - Hi Gordon, I didn't know you had a TS-820S. Did you just get it?

Hi Ellen,
Yes, I was given it about 10 days ago. I have already replaced 6 diodes and a few Resistors along with the Transformer. It works GREAT on Receive, But will NOT transmit.
Mine is the TRIO TS-820S ,
With the help of some of the Guru's here,(Mostly Walt) I am slowly getting it up and Running. I also have a MINT TS-830S and a TS-570S which is my Primary Rig. I do like my Kenwoods!!
I worked Saudia Arabia last evening on 20, So I'm having fun chasing the DX. How about you, What have you been doing since you got your 820 up and running?

73,
Gordon

Hi Walt,

Not much. I've been begging for SKCC skeds, and I'm also looking for phone skeds, so I can get some data for the group on the Ken's Electronics hand mic I bought for my TS-820.

I love my 820. I used to use a TS-830S at W9YT, the Univ. of WI ham club back in the mid 80s, so using my 802 is basically 2nd nature for me. I had forgotten just how quiet the receivers on these things can be. The receiver and phone audio is also fantastic. It puts my IC-703 plus (which also had DSP) to shame. I can hear stuff clearly on my '820, that is almost down in the noise on my '703. Kerry, WD5ABC, and I might sked on 20m phone tomorrow, while he's driving home from a business trip. I also have a 80m CW sked with Rich Arland K7SZ tomorrow night, but I have feeling that tomorrow's bad weather is going to make that a bust.

Listen to Walt & the other experts. They have great advice. They sure helped me. When I got mine, I had to replace resistors in the finals (one was OK, and one was iffy,so I replaced both) and high voltage boards (3 of these were burned out). My finals were almost toast, so I replaced those, and neutralized the new ones (finally!, I've been sick for so long) this last Sunday. I also got my hands on a 500 Hz CW filter, and installed it.

At the present time, the IC-703 Plus is only my contest machine, digital radio, and 6m rig. I like my TS-820 that much. The 500 Hz filter is always on, when I do CW. The filter has better audio, and seems to have less insertion loss, than the 500 Hz filter in my IC-703 Plus. So, the TS-820 has become my main HF rig. I can alos do QRP CW, but lowering the carrier level.

73,
Ellen - AF9J

I tell you,

Hi Ellen,
I think your TS-820 is most likely from late 1976 through 1977. The digital display was offered as an option for a time, but from the ads in QST and CQ, I gather that few TS-820 models were sold by the end of 1977. The TS-520S had come out by then and had most of the features of the TS-820 (except for the IF shift and voice monitor). I was never able to determine the age of my TS-520S except that it has to be from mid 1977 to mid 1979.
I have 14 HF rigs; Swan, Galaxy, Heathkit, Icom and the Kenwood, and I have been able to find the date for all but the Kenwood to the nearest month.
Just my 2 cents. I hope this helps a little

From: ve3fh
Topic: 7520 Message: 7555

I am afraid YG-455C and YG-455C-1 are not compatible with each, they are physically different one: is a solder type and the other is a plug-in style. And, more importantly, their center frequencies are different: 455.7kHz vs. 455.0kHz. I have a table with the specs for many Kenwood filters, I can upload it if anybody wants it, not sure where I got though.

I do have a YG-455C in my TS-830S but I am not selling it, and I am looking for a YG-455C-1 for my TS-940S in case anyone has one for sale please let me know.

Someone who has a YG-455C for sale emailed me about two weeks ago if I find that email I will let you know.

7556. Kenwood TS-520SE INSTRUCTION Manual Available

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-11 06:23:40 UTC
From: Ravenswood
Topic: 7556 Message: 7556

The Kenwood TS-520SE Instruction Manual is now Available as PDF.

Due to high demand for the TS-520SE INSTRUCTION MANUAL, it is now
available to view/download. Due to limited Yahoo space, it's on a
private server.

It's of rather large size (20mb, but HQ and enlarges nicely to 600%)
and won't fit comfortably in the Yahoo groups. If anyone can make it
smaller w/o losing quality, please let me know.

Check in to the Yahoo astaticmicrophones* group and view the LINKS
section for Kenwood TS-520SE to download the full INSTRUCTION manual.

I've not found this manual anywhere else on the web. If there are any
copyright issues, please advise and I'll pull it.

On a side note, I now have the original manual for anyone who wants
it. Offers can email or message me. I figure at about 15 bucks,
plus shipping will get it to your door at about 1/2 price elsewhere.

PayPal is fine.

Frank, K2NCC

A safety pin and a razor blade works too. However, when I saved up 75 cents
from mowing lawns, I went to the hobby shop and purchased a germanium diode.

If possible, let me know what pins that you replaced. When the time comes to remove the light bulb be SURE that you have the proper fuse installed. I think it is 5 no more than 6 amps for 120 v operation and 4 amps for 220 volt operation. It must be a fast blow type.

Check the SG switch from time to time as it can get easily bumped. I picture a Murphy's law scenario where you fixed the grid bias problem when you fixed the pin connectors but bumped the SG switch in the process leaving you chasing wild gooses. Hey, that's the kind of thing that happens to me.

In USB mode, Transmit
Check the voltage on the point FG on the Final unit board. It should be a minus voltage. Now this is where my diagram lets me down. If you have a diagram, can you see what the voltages are supposed on the B,E,C of Q5 on the RF board. The voltage on FG should be minus and change as you change the bias control. The bias control controls Q5 and Q5 controls the bias to the control grid.

My diagram is very bad in the area of Q5 and I cannot read the voltages. If the bias control does not change the voltage at FG, go to the center wiper of the bias control and see if it changes as you change the bias control.

Check the voltages on the E, B and C of Q5 on the RF board.

The voltages may read a tiny bit low with the light bulb in line.

From: Ellen R
Topic: 7550 Message: 7560

Thanks Bob,

I sort of figured that it was an early version, since the rigs weren't called the TS-820S, until the digital display was made a standard feature. Does the TS-520S come standard with a speech processor (like my 820 has)? I only had a TS-520S for a couple of months or so back in the spring/early summer of 1986, so I don't remember if I ever saw it on the TS-520S I used to own.

73,
Ellen - AF9J

7561. Re: YG455C Filter for 830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-11 13:46:04 UTC
From: belbert2002
Topic: 7520 Message: 7561

Julio, your posting is much appreciated. I found a few of the YG455C1 filters posed for sale on www.eHam.net, eBay and www.qth.com. Check these and you'll find them. They seem to go for between $80 and $100 US. If you know a listing of the right filter, I'd appreciate hearing via email. Please send me an email if you have trouble finding the filter you want (k6zb@arrl.net)

I'm curious if you think that this filter is that much of a help over just having the YK-88C.

Best 73, Bruce K6ZB

7562. Heather switch

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-11 15:04:48 UTC
From: Daniel
Topic: 7562 Message: 7562

Hi folks

The TS-520S has a heater switch to save the tube-live on RX. But the TS-520SE doesn't have a heater switch. How is this solved at the SE model?

Daniel, HB9DDS

PS: Thanks all for the tipps, hints and URL's for a operating manual for the TS-520SE!

7563. Re: Ts-820S

Yahoo group: TS-520_820_530_830 (2006)

Here goes Walt,
I repaired pins # 7 on the RF2 connector and pins #4 #9 and # 10 on the RF 3 connector.
I checked, The SG switch is ON.
I checked the voltages on the Q5 transistor. My diagram (very clearly) shows two sets of numbers for each one. I assume one is in receive and the other in transmit. I have the upper value of each whether I am in transmit or receive. The Diagram shows (-97 over -50 for the base) (2.8 over 2.8 for the collector) and (-98 over -51 on the Emitter) On my rig the voltages are:
The E voltage is -97 the B voltage is -97 and the C is +2.8
I show -97 at the FG terminal. Also, the voltages on the Base and the Emitter along with the FG terminal, all change up or down about 5 volts when turning the Bias control (from -92 to -102). These voltages DO NOT change at all whether I am in receive or transmit and I still have NO bias reading.
Maybe a bad Q5 ??

I appreciate all the help Walt.
Vry 73,
Gordon

hi frank,

can you also upload it to HamFTP ? (AKA RUBE ?)

http://groups.yahoo.com/group/HAMFTP/

for those that do not know about RUBE,
check the above link.
Many manuals to d/l via ftp and also
space to upload manuals.

Walt, After I checked the voltages on Q5, I went ahead and checked them on the 12by7, Q4 , Q1 and Q8. Everyone of them stays at the upper number no matter if I am in send or receive, and they all match what the schematic says they should be.
On Q2 and Q3 all the Volatges change as the schematic shows they should from receive to transmit.

Hi Ellen,
The TS-520S has a pretty good speech processor, but it's not adjustable as is the one on the 820. As long as the ALC limits are observed, it works great. I have had mine for about 12 years now, and the technician at Burghardts thought the finals (Japanese S2001A) were probably original. It had likely had light use before I got it because the tubes still put out full power, which is pretty good for 27-29 years!
All in all, I
think these are some of the greatest rigs ever made by any company.
If you are still looking for a SSB sched, I would like to give it a try. Give me a time and frequency and we can try to work it out. I am home most evenings.

Hi Daniel,
The TS-520SE has no heater switch; the tubes are on all the time as was the case with all or nearly all tube rigs. That switch in the 520SE switches the cw filter in and out. Conversely, the 520S has no filter switch.

7569. 11 meter Fixed Channel Crystals?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-11 22:00:49 UTC
From: Ravenswood
Topic: 7569 Message: 7569

Can I use any 11 meter crystals to use in my fixed channels selection with the TS-520? I'm not big on CB but it would be nice to listen or use them if needed*. Since I have only for positions in the CH. Select, does that mean I can only listen to four frequencies?

f

* Which brings me to another issue, CB's legal limit on SSB is 12 watts. Can the 520 be used as 'QRP' in any easy fashion?

RE: TS 820S, no IC from final unit, control grid bias does not reduce on transmit.

Gordon:
I think that you may have a base to emitter short on Q5. Remove and test Q5 with your ohm meter. This is done by placing one ohm meter lead on the base lead and measuring the resistance from the base to the emitter and then the base to the collector. Then reverse the ohm meter leads and do the same thing. With the leads in one direction, you should see continuity from the base to the collector and then the emitter. With the leads in the other direction you should see infinite resistance from the base to the collector and then the emitter.

I am betting that you will see a short between the base and the emitter in both directions. If no then we need to find out why the bias is not reducing to 50 v on transmit.

The processor in the 520 is superior to the one in the 820. The one in the 820 would make Rube Goldberg proud. If you want to be loud and are not particularly worried about distortion, the one in the 820 is OK. I am an audiophile and am a bit picky about such things.

Well, that is an interesting observation. For now disregard what I wrote on the last post and I will look into this In the morning when I have more time.

On the AF/AVR board, there is a relay. Is this moving when you go into transmit?

CB rigs must be type approved so Amateur equipment is not legal on CB even
if it meets the power requirements.

Ok, Pulled Q5 and tested base to emitter and base to collector. In one direction shows infinity from base to either emitter or collector, reversed the leads and I show continuity from base to emitter and Base to collector. So, Doesn't look like it's shorted..
Where do I go from here? Walt, what is supposed to reduce the Bias on transmit to Q5 ?

Walt, Correct me if I am wrong but shouldn't pin 9 (RLK) of the RF connector 2 be pulled to ground through the relay when I switch to transmit? If it is supposed to, It doesn'T. If I'm reading this schematic correctly, when the RFK circuit is shorted to ground through the relay, That in turn would pull the one side of the Bias control pot to ground and reduce the Voltage on VR2 which is the base of Q5.

Could I have found it? If so, WHERE can I get a realy for this old rig?

thanks Walt,
73,
Gordon

Walt,
I now have Bias Current! It was a broken terminal inside the 6 pin connector the goes to the Relay Board for that RLK circuit. With the terminal broken, The RLK cicuit couild not go to ground through the relay, thus no volatge drop on the base of Q5.
I also need to get a relay as this one seems a bit sticky!
Now I will go and see if I can get the thing to load up.
THANK you for all your Help! I'll let you know how it goes.

Walt and Group,
The bad terminal on pin 5 of the 6 pin connector for the Relay board
was the Problem. I now have 60 ma. of bias at idle, I can Load and I
get about 110 Watts output. I just made 3 consecutive QSO's with North
Dakota, Pa and Pa. All three said the rig sounds GREAT !
I'm a Happy Guy.
Thanks To Walt and the Group for all your Help.
I still need to know where to get the Relay for this thing.
Best 73,
Gordon

Thanks for that Walt. Meanwhile, I've looked up some details about CB radio usage. I have a friend (don't we all) who exceeds the legal limits so I dug around to give him some tips (and warnings!)

Some interesting points I've found about CB radio usage*:

"You must use an FCC certified transmitter. No modifications are allowed to your equipment. Equipment output power is limited to 4 watts for AM transmitters and 12 watts PEP (peak envelope power) for single sideband (SSB) transmitters.

"There are no restrictions on size or type of antennas, except the antenna must not be more than 20 feet above the highest point of the structure it is mounted to and may not be more than 60 feet above the ground.

"It should be noted that under Part 95, Subpart D of the FCC rules it is illegal to engage in, or attempt to engage in communications with any station more than 250 kilometers (155.3 miles) from your location.

"There is a gap between Channel 22 and Channel 23 (which was later filled by Channels 24 and 25) for historical reasons. Before CB was in existence, there was an Amateur 11-meter band from 26.96 to 27.23 MHz, and a frequency for radio-controlled devices at 27.255 MHz. The 11-meter band became CB Channels 1 to 22, and the radio control frequency was shared with Channel 23."

SOURCE: http://en.wikipedia.org/wiki/Citizens'_band_radio

* The Citizens' Band radio services are described in part 95 of the Federal Communications Commission.

Makes one really appreciate the advantages of getting a ham radio license!

Hi Frank,

CW QRP can be pretty easily done on the TS-520 (or the other Kenwood hybrids for that matter). You just have to turn the Carrier level down (I did this with the Univ. of WI ham club's TS-830S, in order to work QRP in the mid 80s), but you might have to retune the finals, of the signal turns out to be dirty.

As for SSB QRP - no there is no quck and easy "turn a knob solution." You could turn down the mic gain, but then your modulation and audio would be lousy. The easiest way to do it, is to trick the ALC circuit, by feeding voltage (oftentimes just as simple as a 9V battery), into the appropriate acessory pin, on the back panel.

73,
Ellen

Hi Walt,

I keep the compression level on my TS-820 below 12 o-clock, and the mic gain no more than 1 o-clock. I'm also a fiend about monitoring the ALC. I don't like to use too much gain or compression in general, because it has a tendancy to ruin clarity, and make things too muffled, and bassy sounding. I guess it's the guitarist in me (I used to play lead guitar semi-pro in rock bands); it makes me audio fussy.

As a result, I have often had unsolicted comments about having decent audio. I'll have to see if this holds true with my '820.

Ms Mills-

I'm assuming it doesn't say so on the front of the radio, under the tuning knob? If not, one easy way to tell from an arm's length is that the WWV option is on the BAND switch on the 520S (to the right of the dial), whereas on the 520, it's a seperate silver push-button (on the left side of the dial.)

There are many other ways to tell, and I'm sure others can offer more info. Look at the links below to see pictures to get a better idea. (As found via Google Images.)

TS-520: http://www.dbeweb.com/Kenwood/TS-520.jpg
TS-520S: http://www.universal-radio.com/catalog/hamhf/ts520sL.jpg
TS-520SE: http://www.universal-radio.com/catalog/hamhf/ts520seL.jpg

Hi Bob

I know the details. My questions was when there is no heater swich, does this shorten the tube's life? If yes I'm wondering what is the reason to "forgot" this swich!!

29.1 Problem on the TS-520SE:

When I switch to the 29.1 position on the band selector switch, I have no RX and TX signal (and nothing to display on the DG-5). Position 28, 28.5 and all others are OK.
Any ideas??

Daniel, HB9DDS

The reason for the heater switch was to reduce the current when operating with a DC supply. I would not worry about the lack of the heater switch. Often these switched failed and we disable them leaving the heaters on.

In the US, these rig often were modified for use on the 11 meter band. Sometimes one or more of the ten meter crystals is wrong or missing. I suspect that the band crystal is either not running or is missing.

Hi Daniel,
Sorry to have misunderstood your question. I seldom turn off the heaters on my 520S and I believe the finals have been in there for 27-29 years, since the rig was new, with no sign of weakness. I doubt that it has much effect at all on tube life.
As Walt pointed out, the purpose was to reduce current when operating DC and just listening.

hi Jody,

Can you post more info on what functions are not working ?

One example is static on receive, no stations at all,
common cause is missing 9 pin male plug at the rear of
the radio, this jumpers pins 8+9 for the VFO.

Do you have owner/service manuals ?

Good luck with your studies.

Subject: [TS-520_820_530_830] Any knowledge on how to date Kenwood hybrids.

Hi Again Everybody,

No, I don't have another problem with my TS-820. LOL The little historian inside of me is wondering how old my cool TS-820 is. I briefly looked on the back panel, but I can't find a serial number (although it could be concealed by the bottom connectors. Does anybody know how to date the TS-820 (or any of the other hybrids for that matter)? Is there a serial number, and if so what is the numbering scheme? All I have to go off of so far, is the front panel, which literally says "Kenwood TS-820", which I think indicates that it's an earlier one (I think all of the later ones automatically came with the digital display [which mine doesn't have], and were badeged "Kenwood TS-820S]). Can somebody enlighten me on this?

73,
Ellen - AF9J

P.S. - anybody interested in skedding, so I can get more audio data (for the group) on the mic I got from Ken's Electronics?

P.P.S. - Hi Gordon, I didn't know you had a TS-820S. Did you just get it?

Hi Jody.

There are 2 ways to tell, which is which:

1. The logo below the tuning dial - the TS-520 logo will be "TS-520".
The TS-520S logo will be "TS-520S".

2. The bandswitch - if you're missing the logo on your radio, just
check the bands shown on the bandswitch. Both radios cover 80-10
meters. BUT, the TS-520S also covers 160 meters. This will be the
bandswitch position labled "1.8".

Of the two, the TS-520S is more common (and also more popular).

73 from another YL,
Ellen - AF9J

7590. Re: [TS-520_820_530_830] ALC circuit

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-12 19:23:52 UTC
From: y4562@comcast.net
Topic: 7403 Message: 7590

I seem to have a simular problem with my ALC and Speech Processor Compression with no meter indication as Adrian. The ALC seems to be working as is the speech processor just no meter indication. About ready to checkout the meter amplifier circuits. IP, RF and HV meter indications are ok. Also the noise blanker seems to be inoperative.

Anyone in the group had similar problems and found a solution? There seems to be an expert near Atlanta, Ga. named Bill that I have heard is familiar with the ins and outs of the TS-830. This radio is pretty trouble free since I don't read much about any problems with this radio.

Any help would be appreciated before I dig in further.

Subject: [TS-520_820_530_830] ALC circuit

Anyone know how the ALC feedback circuit works in the TS-830S? I
trace the signal from the FG signal of the finals to the AF board,
then to the IF board, then to the meter (mode switch set to TUNE,
meter switch set to ALC). Through it all it is an RF signal at the
carrier frequency (if I remember right, ~7.2 MHz). The FG signal at
the start is about 20Vp-p amplitude. At the first transistor stage on
the AF board it is attenuated and picks up a -9VDC bias, to become a
signal oscillating from -13V to -5V but then by the time it gets to
the meter (through the other transistor stages of the AF and IF
boards), it is of about the same AC/RF amplitude, but 0 VDC biased,
and I get no deflection of the meter. Is this signal supposed to be
RF by the time it gets to the meter? Is it just that my original 20V
p-p is too small to cause an ALC value? What is this meter really
displaying? The DC component of the voltage? The meter seems to work
on the other settings, so I don't think the meter itself is defective.

Thanks for any help - Adrian, KB1NFW

I found an online source for Relays, But Am NOT sure what the correct
part number is for the T/R relay on the Relay board # X43-1190-00
There is a couple of relays listed ther, but under description it
just says "Relay" . They also list the Relay board, but it's $69.00
and doesn't say if it comes with the relay.
So, Anyone know the Correct part number? Is it S51-4013-05

I am a new owner of a TS-830s and can't figure out how to determine a station's RST using the 830's meter. What meter setting do I use and how do I read the meter?

I realize this is a very rudimentary question, but I would really like to give stations an honest RST rather than the standard "5/9".

Thanks for the help!

Kevin, KI4KFS

7600. Re: Determining Signal Strength on TS-830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-14 04:06:46 UTC
From: Ravenswood
Topic: 7597 Message: 7600

The TS-830S instruction manual says:

"In receive the meter is automatically an S-meter, and shows received signal strength on a scale of 0 to 40 db over S9

"Turn fully clockwise [the RF GAIN control] for maximum gain and a correct S-meter reading.

"In transmit, meter function depends on the position of the METER switch..."

Also, the S-meter is usually derived from the receiver AGC, thus be sure to have your AGC enabled. OFF will not show a S-meter reading.

Hope that helps.

7602. TS-820, and Ken's Electronics mic info

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-14 14:05:56 UTC
From: Ellen R
Topic: 7602 Message: 7602

Hi Everybody,

Bob, KI0KM, and I were able to hook up in our 40m sked on Thursday night, and in spite of the QRN (S7 to S8 noise), I had 2 other QSOs after Bob and I finshed up. All of the audio reports were good for the mic I bought from Ken's Electronics.

The rig's working OK, but I may have to do a ittle more tweaking. It's putting out (into my dummy load), about 70-90W, and I'm not seeing a really pronounced dip, when I dip the plate current. The dip is there, but it isn't much. Also, on the 40m phone band, I pretty much have to max out the load control in the counterclockwise direction. I'm not sure if these are any real concerns. They could just be due to the fact that my new finals are 6146Ws, and not the 6146Bs the Kenwood hybrids were originally designed to run with. Yes, I know they are both 6146 tubes, but since one has a W, and the other a B designation, that means that there are some electrical differences (kind of like the difference between a KT-66, and a 6L6 tube - both are 6L6 types used in early Marshall guitar amps, but they both behave a little differently in a Marshall amp).

73,
Ellen - AF9J

P.S. - the weather is lousy (cold and rainy), and I have a couple of free hours, until I have to go help out at the animal shelter. I think I'll fire up the TS-820, and get dome more mic data. I'll start on 50, and them move to 20 or 15m.

Topic: 7597 Message: 7603

Hi Kevin,

The RST system came long before there were S meters. It's all done by ear. Give the other op an honest report, based on what you hear, not on what your meter says you hear. Also offer your operating conditions, antenna(details), QTH, QSB/QRM, and your receiver. This will give the other op a better understanding of how they are really performing with the propagation conditions. Have fun with that 830S, it's a very nice rig.

From: belbert2002
Topic: 7407 Message: 7605

All of the fileter options are given on page 24 of the instruction manual (the next to last entry in the table has a missing "N" after "Y55C). The CW filers are still available from individuals using the Internet. I recently purchased a TS-830S with the cw filter for the 8.83 MHz IF installed. That's the YK-88C version with 500 Hz bandwidth, in the small can that plugs in. These show up on eBay and posting sites like QTH.com and seem to sell for around $80.

I just purchased the CW filter for the 455 kHz IF, the YG-455CN which is soldered in and has 250 Hz bandwidth (the YG-455C has 500 Hz bandwidth), which I found on eBay last Friday. I searched for "Kenwood YG filter" and the posting came up. The 455 kHz CW filters don't seem to come on the market very often. So, with a little patience, you will be successful getting your hands on one of the CW filter types for your rig.

My intention is to install the new 250 Hz filter along with the other one at 500 Hz filter and see how they play together. Something I'm toying with is to make that "filter switch" mod and do it so that I can switch the narrow filter in separately from the wider one and thus have two different CW filter bandwidths. I think that the two position switch called FIXED might be a good choice for that purpose as I don't plan to run crystals. Any comments would be appreciated.

Hi all, I have a nice 82? (SN 46?488) with good tubes
and matching VFO-82? (SN 64??35) with cable for sale
at Dayton. Included is the 82? manual, chrome D1?4
mike on Astatic PTT stand, spare new 12BY7A driver
tube, shorting plug for using rig without the external
VFO and AC cord. The rig has the DG1A installed but
this unit needs minor repair to correct a digit that
occasionally floats. Can be seen at Dayton flea
market spot #2194. Asking $350 for everything, don't
want to separate pieces. Also have 820(S) Service
Manual in excellent condition for $15. Inquiries
welcomed at: w8jv@... prior to Thursday 5/18.
This is a nice rig but I just don't need it any more,
have an 83?S station that I use now. Thanks and 73

Hi Bill,

As an avid Ebayer who has bought and sold many items, my first word of advice is know the item and be honest in your description. I've seen too many 830s up for auction where the seller simply cut and pasted the basic specs but never included such information as the types of filters installed (if any), serial number, ownership history, service history, signal reports you've received, etc. The more detail you provide the more interest you will generate which will translate into more bids. Put your call sign in the description as well. I think a lot of people searching Ebay for rigs are more likely to buy from a fellow ham than from a "Power Seller". Include photos of the front, side, back and bottom. Finally, avoid setting a reserve. Nothing is more irritating to a bidder than submitting a reasonable bid only to find out that the reserve has not been met. This practice forces bidders to bid against themselves and will drive bidders away. Good luck and I hope you get the price your shooting for.

73,
Kevin

Hi Bill,

I've done a lot of selling (and too much buying) on eBay and I think that good photos are very important. You want the prospective buyer to look at the photos and think, "boy, I'd really like to have that one". I try to make the photos answer as many questions about the item as I can. I always like to have good shots showing the insides of a rig. Of course this assumes the rig is in good condition! I think sometime spent cleaning a piece of equipment before you photograph it is time well spent.

When you do sell your 830, pack it well and insure it. If you take a check, make sure it clears your bank before shipping. It's hard to go wrong selling on eBay if you just take some common sense precautions. I've sold a lot of equipment to overseas buyers without any problems, and selling overseas can open up your market.

Good luck and 73,

George

Gordon;
In the TS820/S, this is a low frequency choke on the 14V Line and it is located on the topside of the chassis in the back left corner right next to the main transformer (it looks like a filament transformer) the part number is L15-0002-15 which is pointed out on page 21 of the parts list in the Service manual (right above the ANT relay in the list of parts). If you have the TS820S or the TS820 with the Digital readout option the 5V power supply for the option is mounted above it so it is harder to see.

I have been looking at my schematic for my TS-830S and in Tracing
the 14 volt supply, I have come across a component on the Schematic
labeled "CH". It is just to the upper right (on the diagram) of the
Relay board. It looks like some sort of Push switch, but problem is, I
have no idea what "CH" is or where "CH" is located. Can anyone tell me?

thanks.
Gordon

Thanks Dennis,
I see it. I would have NEVER guessed that the Symbol on the
Schematic was for a choke!

> In the TS820/S, this is a low frequency choke on the 14V
Line and it is located on the topside of the chassis in the back left
corner right next to the main transformer (it looks like a filament
transformer) the part number is L15-0002-15 which is pointed out on
page 21 of the parts list in the Service manual (right above the ANT
relay in the list of parts). If you have the TS820S or the TS820 with
the Digital readout option the 5V power supply for the option is
mounted above it so it is harder to see.

HI all.
Thanks to James I have an old TS-530S that works like
new after replacing the hv caps.
I am now going to completly clean and replace a
cracked band switch coupling. I am looking for a metal
coupling, anyone know a source? And how best to clean
the old girls innards. Any help will be appreciated.
Also I am considering the purchase of a matched pair
of 6146W tubes. Ellen I think i read where you
replaced your finals with 6146w tubes, Did you get
them nuteralized to your satisfaction?
Thanks George K0GWD

From: Phil Hartwell
Topic: 7617 Message: 7617

Hi Gordon,
My circuit drawings show no "CH" but there is a choke L5 which is located between the two largest electrolytic capacitors C83 & C84 on the AF board.
The 14 volt supply feeds this circuit, which is the 12 Volt regulator based around transistor Q34 and associated components, which in turn feeds the 9.000 Volt regulator Q30. Adjust VR4 on the AF board for exactly 9.000V at TP6 WRT TPG. This supply feeds the VFO amongst other things and must be rock steady.
Best 73, Phil, VK6ABL.

Hi George,

Yes I did get them decently neutralized. My TS-820 works fine. But the power does eem to be about 10-20W lower that what a typical Kenwood hybrid should put out (about 100W). I'm not sure if this is due something else needing tweaking, or if this is just due to the fact that a 6146W is not exactly identical to a 6146B (which is what these rigs originally came with). The problem is, that 6146Bs seem to be very hard to find.

73,
Ellen - AF9J

It shouldn't be "Permantly" fixed. Mine has a small metal strip that runs up the inside of the black coat against the glass of the Tube grounding the Coat. It should just slide right off,Somtimes (actually most of the time) the tube will come out of the socket with the black coat attached, then I just slide the tube out, although it might be a bit tight.
At least this has been my Experience.

Topic: 7619 Message: 7624

Daniel;
The coat over the driver tube is a metal tube shield to prevent any emissions from the tube affecting other circuits in the general area. The shield is not "fixed" on the bottom but there is a shield grounding mechanism connected to the tube socket that has a long pin like extrusion that slides between the shield and the tube which grounds the shield and therefore any emissions making it to the shield go to ground. When you remove the tube, pull it (by the shield) straight out of the socket. The shield is real tight around the tube so it usually will not seperate from the tube. You will see the pin/extrusion as you remove the tube/shield assembly. On the tube socket the pin/extrusion is positioned between tube pins 1 & 9 (when re-installing the tube/shield assembly into the tube socket this can be used as your guide when trying to line up the tube pins to the socket as it is somewhat difficult to re-install). When re-installing the tube/shield, the pin/extrusion slides between the tube & shield assembly right up between pin 1 &9 (real tight, so be patient guiding it as you don't want to break that pin/extrusion off and loose the ground to the shield).

7629. Side Tone Circuit in TS-820S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-17 21:55:58 UTC
From: Gordon
Topic: 7629 Message: 7629

I have my 820 working pretty darn good now. Other then the Speech processor, everything is working PERFECT, or so I thought. I went to use it on CW today and I get NO sound from the Sidetone. I checked VR3 on the AF-AVR unit and it appears to check good. When I key the rig, All I get is a clicking from the speaker.. No Sidetone. Does the Sidetone come from the FIX-VOX unit or does it come from the AF- AVR unit ? I see in the schematic a circuit labeled ST from the FIX-VOX to the AF_AVF unit.
Any hints?

73,
Gordon

Hi Ellen,
My little TS-820S came with the Original Tubes # S2001A. I get 125
watts output to the Antenna with these tubes.
I had purchased the 6146B's from RF parts last year. So they used to
have them.

Gordon;
Q12 on the Fix-Vox unit is the Sidetone Oscillator and it's output is fed to VR3 on the AF-AVR unit where you adjust the Sidetone input level to the AF-Amp TA7201P (same input as received audio, so if that is working the Sidetone Osc signal is either missing or being lost across a bad connection between the two boards or VR3 is corroded and you cannot tap enough signal off of it to drive the AF-Amp.

when fitting the shield back on to the tube
the tube is split from top to bottom acts like a clamp what one does is here
is align the 2 edges of the shield tube so that they are edge to edge thus
enables the tube to be slid on to the driver bottle ...and make sure that
the earthling strap is inside the tube when in place give the edge the black
tube a slight pressure with the fingers and the tube will snap into place
again also be careful when fitting the tube there are small resistors
around the bottom of the tube very easy to get one fowled up in the tube
when fitting back

Thanks for the tips Dennis, Here is something else I noticed. I can adjust the Vox to activate during SSB operation,and it works great, But It will NOT activate during CW operation , no matter how high I turn up the gain. Is that telling us something ?? I'm sort of LOST in chasing this Sidetone down!! Received Audio works fine... just NO side tone. VR3 seems to check out ok with an ohm meter.

Thanks,
Gordon

Gordon;
The output of the Sidetone Osc on the FIX-VOX board also feeds the VOX Amp so what it tells us is that the Sidetone Osc isn't functioning therefore no Sidetone Audio and or VOX operation. I would clean the mode switch (pay most attention to the CW tab), the key jack and the connector pins on the FX3 connector to the FIX-VOX board. The key down should start up the Sidetone Osc, so either you have a connection problem in the key path that enables the Sidetone Osc or something in the Osc circuit is defective preventing it from oscilating.

Hi Gordon,

I got my 6146Ws from RF parts about a month ago (I was sick for a for
a few weeks, so I took me a while to get things done with the rig).
I asked them on the phone how much the 6146Bs they had listed,
as "Call for Price", were going for, and they told me that the
6146Bs, were no longer available from them.

Thanks Dennis,
I will get into it and trouble shoot it tomorrow.
I appreciate All your help on this. I figured it was an Oscillator
problem since the VOX was acting up in CW mode also.
Right now I am playing with an almost brand New TS-850S with ALL the
filters that I aquired today. Wow, What a Nice Rig !!
It will take me a couple of days to figure out all the controls on
this thing.
I'll keep you posted on the 820 progress.

73,
Gordon

Probably, but I didn't really feel like spending time looking for them. The old set of Phillips that were in my TS-820 (yes it really is the early analog dial version), were pretty much toast (I couldn't get much more than 30 or 40 watts out of them on 20m). I have no complaints about the new tubes (fter all, don't forget, I also do a fair amount of QRP operating). I've received good reports on my CW & SSB transmit audio. So I can live with it. Besides, maybe all it needs is a little tweaking (when I find the time), to bring it up to 100 watts, I don't know.

HI ELLEN:
Surplus Sales Of Nebraska have the 6146B tubes.
I think the price is $45.00 each.
www.surplussales.com/Tubes-Soc-Acc/TubeSpecials.html
That should get u there on the web.

Hi Goerge,

Thanks for the info. As it is though, I think I'll stick with my 6146Ws for now. I have major car repairs (to the tune of several hundred dollars), coming up in the future (it's an emissions control problem I found out about on Tuesday), and money is still sort of tight for me, since I'm still paying off bills incurred during the hard times I ahd a few years ago. $90 for a set of 6146Bs - I figured as much, since the Mil-spec set of 6146Ws I got, cost me $60. I guess I should have bought the set of 6146Bs I was offered by one of the group members, for $65.

I ahve a feeling that in years to come, 6146Bs are going to become as hard to find,and expensive as 6JS6Cs are becoming for Yaesu FT-101s.

6146Ws manufactured after 1965 are equivalent to 6146Bs. Been running Ws in my 530 and FT-901DM for years with no problems.

Hi Steve,

Thanks for the info. Hmmmmmmm, I get plenty of drive from my 12BY7A. That means something else might be wrong. Does anybody have any ideas why my power might be down (my TS-820 is running from 70-90W [depending on the band], instead of the more usual 100-125W)?

OK, it looks like I have another issue to take care of. From the information Steve gave, it looks like I shouldn't have a power output issue, because my new finals are 6146Ws, instead of 6146Bs.

I have a matched set of finals, and I was able to decently neutralize them. I get plenty of drive from the 12BY7A driver tube. But, I have 3 issues:

1. Power is down (I'm only getting about 70-90W output power instead of the more common 100 plus watts).
2. I don't get much of a dip in plate current, during tune up, when you dip the plate current.
3. On 40m, I run out of adjustment in the load control (it's maxed out in the counterclockwise direction), when maxing RF output, during tuneup.

All of the above issues occur, when tuning up into a dummy load. Does anybody have any ideas as to what could be causing these issues. Don't get me wrong, I'm getting decent transmit reports on the air. It's just that I have these 3 little niggling issues. If I have to live with them, I will. But if I can do so, I'd sure like to take care of them.

73,
Ellen - AF9J

Hi Calvin,

Thanks for info. I've decided to stick with the 6146Ws I bought last month. I guess, the issue is, do you still have 6146Bs (I think other group members might like to know). I'm getting the impression that the "B" version of this tube is starting to become a bit scarce.

Hi DW,

Thanks for the info on 6146 tubes. I printed out a copy of it for my records.

Here's an interesting little factoid, that not many people know about - not only were 6146s used for RF work, they were also used in one of the most famous bass guitar amplifiers of all time. The Ampeg SVT. For the first year or so of production of this amp (1969), ampeg used, 6, 6146 tubes in it. This gave it 300 watts of power. In 1970, they switched to using the more common 6550 (6 of them) tube, which also provided 300 watts of power.

73,
Ellen - AF9J

Is it possible to rewire the filaments in such a way
as to use the 12 volt filament versions of the 6146?

We had a guy at a local hamfest selling the 12 volters
for about a buck each.

Yes we do still have 6146B's available singly or in matched pairs. You are correct in that they are getting very scarce and pricey. While we have a good supply of "W's", the "B's" are in very short supply. Not trying to drum up sales with scare tactics here, it's just the reality of the situation. BTW, I use the 6146W's in my 520SE and I'm perfectly happy with them.

I have to chuckle a bit on this one relating Peter's comment to everyday SSB.....You are cruising the band looking for an easy contact, but the guy or gal calling CQ has one of those voices that takes more time than they give you to zero beat, and you are off a smidge. The other side being polite turns on RIT to listen to you, and since you did not have enough time to start with, you RIT the other side.

I'm happy with my 6146Ws too. I guess I'm just wondering why output power seems kind of low, and why I can't get a pronounced plate current dip, when I tune.

7658. 6146B Matched Pair - What Does It Mean

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-19 02:29:40 UTC
From: Kevin Keyes
Topic: 7658 Message: 7658

When a tube vendor mentions a matched pair of 6146B, what does that mean? Also, how do Chinese 6146B tubes compare to those made in USA?

Thanks and 73,
Kevin, KI4KFS

7659. TS-520S No receive, oscillation when band is switched

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-19 03:13:56 UTC
From: markswoodcrafts
Topic: 7659 Message: 7659

My 520s died last night! Changing bands, I lose signal and instead get a ragged oscillation at various frequencies. At first, switching to the calibrator and back solved the problem. Then, shutting off and then back on would cause the rig to receive normal. Now, the receiver is gone and just get the oscillation. No signals at all on receive.

I checked the AVR board and the -6v, 9v and 14v levels are fine. I think the damage is on the IF board.

Anybody have any ideas? Plus, does anyone have a LEGIBLE schematic diagram with voltage levels? I have one from a website, but the voltage levels on the scan are way too hard to read.

Help and thanks!

Hi Ellen,
I got to thinking about your output being not quite
where it should be,have u checked ur plate voltage?
Perhaps your voltage doubler is not quite up to par.
also do u have 60 ma of plate current. You have
probably already checked all this.Any way just thought
i would mention it.

Hi
I know this is slightly off topic but I wonder if anyone can help, I rescued a TS-900 a while back but the PSU had long gone, does anyone have information about the supplies and supply connector pinouts or even a complete circuit diagram? I'd very much like to get this set going again even if only on receive or for transverter service to start with, there's very little information available on the web for the set so any links or pointers would help. A bit of history would be nice too - when were they made and what came before/after them? I suspect that there aren't many TS-900s here in the UK.
Thanks
John

Hi Chris

The answer to your question is, YES, most certainly. The heater supply is in fact 12 volts and the original wiring puts the 6146's heaters in series. Just remove the series link, provide a earth strap for the front tube and run a new wire to supply 12 volts to the most rear tube. About 1 hour job by the time you take covers of and the circuit board and work out what your doing.
I have done this with my TS-520 and also a TS-830. They work great.
Great value for money and probably a well kept secret.
One warning though, is to put a warning on the PA cover that the heaters are set for 12Volts. You dont want to go back there many years laters with a nice new pair of 6146's and watch the sun go up for a few seconds, followed by a very quick sunset and tears. Remembering then is too late.

Here is a little extract from Glen.

The 6146 Family of Tubes

by

Glen E. Zook, K9STH

The 12-volt equivalent of the 6146 is the 6883, the equivalent of the 6146A is the 6883A, and the 6146B is the 6883B. Now, there are the tubes that were manufactured for FM commercial service. These series go as follows: 6883, 6883A / 8032, 6883B / 8032A / 8552. Again most of these are "cross branded" with all of the tube numbers that are equivalent.

Next time Chris, or anyone else for that matter, if you can't get hold of 6146's, don't hesitate to use the alternative at a fraction of the cost.

Stay away from Chinese 6146Bs. The first time I fired up with a pair they shorted out.

Hi Bill,

Yes I do. This is actually my 5th tube or hybrid rig I've owned in my 28 years as a ham. I've always tuned up into a dummy load first. The strange thing is that I don't get much of a plate current dip. But this may be normal. My memory may be failing me on this. But I think even when I used the TS-830S at W9YT (the Univ. of WI ham club's station) in '86 & 87, there wasn't much Plate Currnt dip on it. I'm just not 100% sure on this recollection.

It's possible that I may be used to seeing the major plate current dip I used to get out of the Drake T4XC I used to have years ago (or the FT-101B I had in college, which also had a pretty noticeable plate dip). I'm gonna recheck the dummy load output again today (I'm off of work today, and for a change, I'm not in a hurry to get things tuned up for a sked). I'm pretty sure that I'm getting 70-90W output.

73,
Ellen - AF9J

Topic: 7658 Message: 7665

Hi Kevin,

I think I can answer both quesions.

1. Chinese tubes - like Steve, W4IMF said. Avoid them like the plague. Don't amke the mistoaek I did, and go to a outlet like AES, or HRO and have them sell you a set, without opening the boxes first. I bought a set of Pentas from AES a month and a half ago (hoping I would ahve a qucik fix for a probelm I was having at the time), opened the box, and discovered they were chinese. I had already heard nasty things about chinese tubes, but I tried them anyway. Guess what, they flashed/arced over as soon as I turned on the filament heaters. As a result, I ended up having to fix even more, on my TS-820. MY theory on the reason for the chinese tubes being so nasty is this: Ifg you look at most beam powere tubes like the 6146, you'll see a silvered area on the glass envelope. This is where excess metal ions are captured & sent to by the getter/collectror ring in the tube (it helps keep the vacuum clean, you don't want a dirty/hard vacuum in a tube), Chinese 6146s don't have a getter/collector ring, sand as a result they run a dirty vacuum. This may not be a problem in a 6146 application that's using lower voltage, but Kenwood hybrids run 6146s kind of hard (must applications don't used them over 750V, Kenwood hybrids run them at 800V), so hte chance of arcing/flashing over is greater.

The moral of the story - avoid chinese 6146s like the plague. I'm stuck with a set of them, that I can't even use. Get 6146s from places like RF Parts, or Nebraska Surplus, who you know, won't sell you a set of chinese tubes.

2. Matched tubes - Becuse tubes are to a large extent, assembled by hand, there is some variation in their electrical properties, with regards to voltage, current (and to a smaller extent) voltage amplification characteristics. Since most final amplification circuits (be they in our Kenwoods, or even the tube guitar amps I used to use before I got tired of lugging them around) are of the push-pull type (in other words one half of the siganl [say the posetive half] is amplified by one tube, and the other half [say the negative half] is amplified by the other tube, .his means that the above mentioned variations will cause each tube of an amplifying pair, to not apmplify the same amount of the signal.

This causes all sorts of neat things to happen, since the pair (for lack of a better term) "fights" to remove this imbalance. You can get parasitic oscillation, distortion on the signal, burned out tubes, spurious emissions, etc. When you neutralize the amplifier, you're adjusting using the final amp circuit (in the case of my TS-820, with a

variable capacitor), to electrically balance out the tubes, and avoid the messes I just mentioned. Another thing that helps avoid this mess (and makes neutralization easier to do) is to use a matched set of tubes. A matched set of tubes, is set (or pair for that matter), that have put together, because they have the same electrical characteristics (sorting is done at the time of manufacturing, with a tube tester). You don't need to use a matched set of tubes, but in my opinion, it'
s easier to neutralize your finals, if you are using a matched set.

73,
Ellen - AF9J

Hi George,

I've checked the plate idle current, it's at 60mA. But, maybe I should check the plate voltage, I only gave it a cursory check a few weeks ago. Maybe it is low. It might have been only 780V or so, with the bad, old tubes in. Hmmm, maybe I should recheck it. Thanks for the suggestion.

Hi Ellen,
My plate voltage at idle is Almost 900 Volts on my TS-820S. Hope
that helps you.
I have been busy playing with a NEW toy.
A friend shipped me (Unannounced) a very Nice TS-850S. When I asked
him what it was here on my doorstep for, He replied.. " Happy Birthday
,It's Yours".

Wow, I'm like a kid in a candy store with all of these rigs here now.
This 850 sure is Nice! I need to get back to work on my 820 and fix
the last 2 known problems. The side tone Oscillator and the Pre Amp
circuit. Then I will probably sell it and my "MINT" TS-830S
73,
Gordon

Hi Gordon,

Thanks for the info. On further examination, I may not have a problem. Rob, WB7AVF (who belongs to this group, and the SKCC group that Gordon and I also belng to), and I just finished up a QSO a few minutes ago (It was rough going on 40m CW, and almost as rough going on 20m CW, after we QSYed - lots of QSB). After we were done, I checked output power into my dummy load. Well, it loks like my MFJ 300W aircolled dummy load isn't completely non-reactive. SWR is about 1.2 to 1.3 to 1. So , I used the basic output power formula we all had to know to pass the tests (output power = forward power + reflected power). Guess what, the rig was running about 95-100W out (The meter on the T-match isn't the greatest - it's just a cross-needle power meter, and they're not known for being the world's most accurate meters). I will check the plate voltages again (I think they were running about 900V, when I checked them with the old, bad tubes), but it's looking like my "problem" is a non-issue.

73,
Ellen - AF9J

P.S. - so you're going to get rid of all of your hybrid Kenwoods?

Good observation. By the way the latest wireless mouses for your PC are "CB" mice due, for one reason, to the problems with wireless home networks, 2.4 meg phones, and other toys causing computers to lose the network. I had to change all of my phones out for 5.8 to get rid of the problem, as well as the old 2.4 mouse for a CB Mouse.

I thought the final amp tubes were in parallel and technically did not need to be a matched pair. Seems like this question of the necessity of a matched pair in a Kenwood transceiver came up recently. Can't find it in my archives.

The finals in the Kenwood hybrid rigs are in parallel. When the bias is set
at 60 milliamps, it is assumed that each tube is dawing about 30 millliamps.
This places each tube on the linear part of its amplification curve.
They should be matched because otherwise, one of
the two would draw more current than the other, possibly pushing it into the
non-linear part of its amplification curve, and shortening it's life as well as
causing distortion.

Question, 2.4 meg do you mean 2.4 GHz.

The relay (not the antenna one but RL1 under the VOX board)
is a frequent source of problems now that the units are
getting older. It is difficult to access since you have
to lift the VOX board, but it is not to difficult to
clean.

One thing you might try is when the unit fails to
go into receive, lift the front of the unit about an
inch off the bench and drop it back down. It sounds
like a terrible thing to do, but if it is one of the
relay contacts, the receive will often be restored.
The rig should be easily able to handle the 'bump'.

If you don't have the courage to drop it, then try a
good thump with a closed fist on the side of the unit.

I run a 520S as well and only recently had to clean the
relay.

While you have it open, take a minute to tighten down
the screws holding the boards in place. Many of them
are grounds and a loose ground can also cause problems.

These rigs are aging, but in my opinion are so well
built it is unlikely that other than a dirty relay or
a gassy tube will kill it.

No Bob, you don't need a matched pair. You can neutralize unmatched tubes. But the neutralization is easier to accomplish with a matched pair. In the worst case, if two 6146s are too far off from each other electrically, you might not be able to neutralize them, because the trimmer cap only has a limited adjustment range. Running them 6146s in parallel (in other words, Class A) - I guess it might be the case, but I was always under them impression that they ran Class AB. It's more efficient than Class A, and the tubes would run cooler too. Also tubes run in Class AB, can run more power, than tubes run in Class A (because they run cooler, they have higher power dissipation capabilites).

Hmmm, on second thought maybe you're right - it does run Class A.
after all, isn't it possible to run one of these hybrid rigs with
just one final in a pinch? That wouldn't necessarilhy be possible in
Class AB.

I concur with Irv,

I used to ahve a set of Drake twins that would act up. Oftentimes
the T/R relay would go weird. It would stick, and give me S9+ noise
on receive. I remember operating in a CQ-160m CW contest when this
first happened. Since 160m can get pretty noisy, I thought nothing
of it, until I accidentally bumped into the R4B I was using. Like
magic, all of my noise went away. After having this "noisy receive"
situation happen a few more times (all of which were cured with a rap
to the side of my R4B), I began to realize that it occurred after
transmitting with my T4XC. A rap on the receiver (which had the T/R
relay), fixed the problem. Give it a try. It vever hurt my rigs,
when I did it.

Thanks!
Gave it a try, opened up and cleaned the contacts as well. No dice.
There is no receive signal at all, not even the 25khz calibrator, so I
believe the cause of the trouble may be within the IF board. I found
a service manual and am awaiting it to chase down voltage readings.

One other thing, is there anyone who is a good 520 repair person, and,
you don't have to sell off your entire station to aford them?

Thanks for the help

So has anyone here used a pair of 6293's in their box ?

I understand these are rated at 1Kw for pulse operation.

I ask as the 6883's are more expensive over here than 6146's

Ellen,
The finals in the Kenwood hybrids are run class AB1. The efficiency on SSB is then about 60-65%. In class A the efficiency would be much less. The Heathkit and Collins rigs using 6146s also ran class AB1. For parallel tubes, this gives the highest power output without distortion.

To expound further, SSB amplifiers can be run AB1 because there is no carrier. Therefore, the drive can be set almost to the point that grid current will be drawn. For AM, or audio applications, the drive would need to be much lower to avoid driving the grid positive. This is why these efficient amplifiers can be run singly or in parallel in SSB use and not have to be run push-pull.
Thank you for the 40 meter contact, Ellen!

OK, then I guess I was right. Class AB1 is basically push-pull. Virtually all tube guitar amps are also run AB1. In other words, it's sort of a variation on Class B.

In Class B (pure push-pull), each tube (or for that matter, transistor) of the pair amplifies only 1/2 of the signal, (as viewed on an O-scope) the posetive or the negative half. This allows the tubes to run cooler, since one tube is basically idling, while the other one is amplifying. BUT, tubes can't instantly come up to full power; there is a delay. As a result of this, the two halves of the signal being amplified will not match/meet up properly, to give a decent waveform. This is a nasty sounding form of distortion, full of ugly spurs, called crossover distortion.

This is dealt with, by starting up the idling tube, while the other tube is still amplifying, so that when it's time for idling tube to takke over amplifying the other half of the signal, it is at full power, and the waveform halves match up. This eliminates (as long as you take care to start up the idling tube at the right time), crossover distortion. But when this startup happens, the formerly idling tube is also amplifying some of the other half of the signal. It's sort of, but not really acting in a Class A fashion (where the tube amplifes the entire signal), but as sort of hybrid that is called Class AB. There are diffreent levels of Class AB amplification, that depend upon, when you start powering up the idling tube for use. As Bob mentioned, Kenwood hybrids use CLass AB1.

Bob's also right about the reliability and distortion aspects of Class AB1. Becuse the tubes are running cooler, they last longer, and they are less apt to distort.

From my own personal experience with tube amplification, as a guitarist, I can vouch for that. There are only a few Class A guitar amp designs out there. The most notable, is the Vox AC-30, made famous by the Beatles, and Queen's guitarist, Brian May. It uses a quartet of EL84s (US designation, 6BQ5), in Class A. It's maximum output is 30 watts. By camparison, I gigged for about a year with a Peavy Classic 50 guitar amp. It used a quartet of EL-84s. BUT, it ran Class AB1, and put out 50 watts. It was as reliable as a stone axe, whereas Vox AC30s, may have gotten better, but still have a reputation for blowing tubes (if you run them hard for too long), because they run so hot. But some people like the sound of Class A amps run in the non-linear/distortion region. It's loaded with harmonics (a disastrous thing to deal with in radio applications; all of those spurs, ugh!), and to them is a smoother, sweeter sounding kind of distortion.

By contrast, Class AB amps do not distort as easily (making them more desirable for radio applications). This is not to say that they won't distort. They most certainly will (just listen to a Marshall, or a Mesa Boggie running full tilt, and you'll hear just how brutally Class AB amps can distort), it's just that it takes more work to do it, and it isn't as laden with harmonics/spurs.

Date: 2006-05-21 18:04:13 UTC
From: belbert2002
Topic: 7684 Message: 7684

My Remote DIN socket does not close the circuit that is needed to control a linear amp. The job is done at pins 4, 2 (the center connection)and 5. In RX, pin 5 is closed and Pin 4 is open, as they should be. In Tx, pin 5 is open (as it should be) but pin 4 is also open (should be closed so that the linear is activated).

These go to relay RL1 on the AF board. I popped the dust cover off and it seems OK inside.

Any suggestions on how to clear this up?

Thanks and 73, Bruce K6ZB

You are right. Pins 2 and 5 should close together during transmit. I have my amp wired to 2 and 5 and it works great with the 830S that way. I am looking at a picture of the Relay and during transmit the blu/wht and the red/wht should close coming off the bottom of the Relay. During Receive, the Ylw/wht and the Red/Wht are closed.

7686. TS-530S Filter Capacitor

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-21 19:10:01 UTC
From: Stephen Davis
Topic: 7686 Message: 7686

Hello All,

Does anyone know where I can purchase replacement filter capacitors for the TS-530S. Part number C90-0327-05 (100-uf 500 volt can capacitor). The output on my radio suddenly dropped from 100 watts output to about 40 watts output. The cw tone is chirpy and I only have about 350 volts on the plates of my output tubes. I think all of this points to a bad filter capacitor. I had posted this problem 3 or 4 weeks ago, but then got busy doing other stuff. Bob (G8ACQ) suggested it might be the filter capacitors and it looks like it is. One of the capacitors will "charge up" when I test it with an ohmmeter. The other just shows a high resistance and does not charge. Any thoughts on other tests I could perform would be appreciated. Also any suggestions on a source of replacements for the capacitors.

Thanks

Steve K7QHU

Hi Bruce

The main question is: can you key DIRECTLY the amplifier. Or do you need an external relay because the high current? I'm using generally an ARB-704 from ameritron.

Hi, On page 26 of the TS-830S Instruction manual there are 2 items about Operation with a second receiver.

First one is Operation with a second receiver

Second is Operation as a second receiver.

Has any one done these? If you have 2 TS-830S, could you set them up as described above? What use would this serve?

Thank You, Bob N3DOK

It may be worth using some 'Jewellers Rouge' to polish them out if you
cannot get a glass.

Any half decent Jeweller / Watch maker - repairer should be able to
sell you some. [Not a chain store type !]

From: James D Harrison
Topic: 4389 Message: 7694

I just recieved a SP-520 to complete my station, and after hooking it up it takes almost full volume (9) to hear anything, where the internal speaker sounds good between a setting of (2 - 3).

Is this normal? Or do I need to take the speaker apart, and replace the speaker element? or possiable other cause?

After replacing the finals that kept blowing the fuse, a few weeks ago, I did make my first contact using the TS-520S today, and talked to W2GSB/APM special event station.

Thanks

73 James KG4PBI

7695. Update on my Old TS-820S

Ok, Fixed the Sidetone Oscillator Today. Turned out R-39 (470k) on the FIX - VOX boardwas open therefore Not giving any Voltage to the base of Q-12. Now the Side Tone works Great.
I am still trouble shooting the Speech Processor. I have VERY low output when I switch the Compression on. I checked all the resistors feeding Q-30 on the IF board and they all checked good. I replaced Q-30 just to be sure, but NO luck. I also checked VR-7 and it checks good. Any Suggestions for the Speech processor fix??

Thanks to all for all the help you have given me on this Project.
It's ALMOST done now.
Everything Else seems to work Great on this Old rig !
Just worked the Cayman Islands on 15 meters. Ok, Need to go spend some time with the XYL.
73,
Gordon

Subject: [TS-520_820_530_830] TS-530S Filter Capacitor

Hello All,

Does anyone know where I can purchase replacement filter capacitors for the TS-530S. Part number C90-0327-05 (100-uf 500 volt can capacitor). The output on my radio suddenly dropped from 100 watts output to about 40 watts output. The cw tone is chirpy and I only have about 350 volts on the plates of my output tubes. I think all of this points to a bad filter capacitor. I had posted this problem 3 or 4 weeks ago, but then got busy doing other stuff. Bob (G8ACQ) suggested it might be the filter capacitors and it looks like it is. One of the capacitors will "charge up" when I test it with an ohmmeter. The other just shows a high resistance and does not charge. Any thoughts on other tests I could perform would be appreciated. Also any suggestions on a source of replacements for the capacitors.

Thanks

Steve K7QHU

Daniel, thank you for asking about the linear. The problem is definitely due to the relay, RL1, since there is no contact closure when tested with a continuity checker between pins 2 and 4 of the Remote jack. Regards, Bruce K6ZB

7700. Re: 830S Remote connection will not key linear - and RL1 malfunction

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-22 01:40:56 UTC
From: belbert2002
Topic: 7684 Message: 7700

Gordon, thanks for confirming how the Remote jack and relay are supposed to work. I am sure that the relay, RL1, is not making the proper contact closure.

I went ahead and removed he plastic cover of RL1 (on the AF board) and attempted to clean it. This turned out to be a bad idea because not only is there no contact closure for my linear, but the radio is not receiving! I can get it to receive by twiddling with the relay reeds (facing the connector socket). But, which I let go, the audio drops out. The radio will transmit, however.

It seems to me that I'll need to replace the relay, which hopefully will cure both problems. Is there an easy way to remove relay RL1 and is there a source for this item? Any suggestions are appreciated.

7703. TS830S Kenwood Display lost!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-22 13:36:21 UTC
From: vk4oc
Topic: 7703 Message: 7703

G'day Everyone
I have a little trouble with my TS830s, it's on 3.600Mhz LSB, the minute I go up to 14.200MHZ USB a blank screen and no display.
If I use 14.200 MHZ LSB the display comes up.
Can anyone give me a easy fix or is the switch need a bit oil on the aging old Kenwood.
Hoping someone has had the same trouble in our group.
De.Dennis vk4oc

7704. Dayton Hamvention A Success

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-22 13:46:04 UTC
From: Ken Gunton
Topic: 7704 Message: 7704

The weather was almost perfect for the Hamvention this year. Not much rain, and then only sprinkles from Friday through Sunday.

I purchased a Station Monitor for my TS-830S. It's in cherry condition, and works perfectly. I have never used a station monitor before, and being able to "see" what's going on around my frequency is fascinating. Today, I'll put together another cable so I can use it to monitor my signal and see how I'm doing.

Second purchase was a Heil Pro-Set 5 with an adapter for my rig, and a Heil footswitch. Contacts last night said my audio sounds really good.

Third purchase was a low-pass filter, which resulted in interference to one of the the TVs in the house completely going away.

Anyone know where I can get a VFO-230?

One unfortunate incident was that I missed my Extra by one question, and didn't have time to take another version of the exam, which was offered free..... more studying needed. Next month I'll take it.... I'm so tired of seeing all that DX from 14.000 to 14.025.... hi

Ken,
W8ASA

7705. TS830S Kenwood Display lost

Hi Everyone
I have a little trouble with my TS830S, the display unit is lost when I go into USB. I give you example, I'm on 3.600 MHZ LSB, if I switch it up to 3.600 MHZ USB all the display is lost.
The same on 14.200 MHZ. USB. switch it to LSB display comes back.
I hoping it may be a quick fix, put a bit of oil on the switch, can anyone help me with this little problem.
If you had this type of trouble could you advise me on a fix.
Or something could be something internal needing fixing.
De.Dennis VK4OC in Tallegalla Queensland Australia.

Hey Ellen, after reading the discussion about class A, AB, AB1, B, push-pull amps, I sure hope you stick around on this group. You are on the way to becoming a "Walt-class" resource! :)

I thought I'd give a comment on the plate dip; on my TS830 I see a pronounced dip on some bands (20m and up) and I see a barely perceptible dip on lower bands (40m, 80m, 160m). So I doubt that you have a problem. Or if you do, I also have it.

Subject: [TS-520_820_530_830] Re: 6146B Tubes

Hi Bill,

Yes I do. This is actually my 5th tube or hybrid rig I've owned in my 28 years as a ham. I've always tuned up into a dummy load first. The strange thing is that I don't get much of a plate current dip. But this may be normal. My memory may be failing me on this. But I think even when I used the TS-830S at W9YT (the Univ. of WI ham club's station) in '86 & 87, there wasn't much Plate Currnt dip on it. I'm just not 100% sure on this recollection.

It's possible that I may be used to seeing the major plate current dip I used to get out of the Drake T4XC I used to have years ago (or the FT-101B I had in college, which also had a pretty noticeable plate dip). I'm gonna recheck the dummy load output again today (I'm off of work today, and for a change, I'm not in a hurry to get things tuned up for a sked). I'm pretty sure that I'm getting 70-90W output.

73,
Ellen - AF9J

Objet : [TS-520_820_530_830] TS-520S - IF Frequency ??

Can anyone verify that the IF frequency, where the xtal filter
operates, is 3395khz??

My hope is to pick off this signal prior to the xtal filter. Then feed
it to a Software Defined Receiver (SDR). Use the DSP program to create
a wide range of free filters, noise reduction, and impulse noise
limiting. I would retain the "first half" of the 520 which gives me
band-switching. front-end preselector, a nice VFO, and of course
transmitting. Transmitting should not be affected since I am not
interrupting the signal path.

Dick N3HKN

No need...relay is matched to the TL922 which also uses a 125vac relay...do not use direct with Icom or Yaesu tho,...Jeff..W0XV

Suggest you investigate the soft-key module from Harbach Electronics (www.harbachelectronics.com). Been using it with my 530 and SB-200 for a long time. It's cheap and protects the relay from the high keying voltage of the amp.

Okay, color me dumb. The radio is a 520s, according to the plainly obvious label. Too many 14 hour workdays I guess!

As to what is wrong with the radio, the person I bought it from on ebay some time ago said that they turned it on, heard a popping sound, saw a wisp of smoke, and the radio failed to work from that point on. I contacted Byron Campbell (wa4geg) and he said (if I remember correctly) that it sounds like some sort of fuse or some such. As you can see by now, I'm no electronics expert. My main concern at the moment is getting my licenses and getting on the air with the best budget-conscious equipment I can get. I do plan to learn the electronics stuff eventually. I hear the Forrest Mims books are supposed to be good.

Jody (by the way, I'm a guy, but no harm done!)

7714. Kenwood SM-220 Installation

Topic: 7714 Message: 7714

For those of you who are interested in interfacing the Kenwood SM-220 Station Monitor with other equipment from either Kenwood or others I would like to direct you to my June 2006 column ("Math's Notes") in CQ Magazine. In this column I give detailed directions as to how to modify the BS-5 or BS-8 panadapter modules to any IF from 3.5MHz to 10.7MHz regardless of which module you have. Also given is information as to how and where to determine the proper IF takeoff point. I hope this information will be usefull to the many who have expressed interest in this product.

7715. Replacing RL1 Relay

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-23 14:03:17 UTC
From: belbert2002
Topic: 7715 Message: 7715

I'm looking for advice on how to replace the RL1 relay on the AF board of the TS-830. I've ordered a new one from East Coast Transistor, and was told it would take 3 weeks for the relay to get to me.

The relay is soldered into the board at several places. So, I guess I need to heat each connection and then suck the solder out. I would then remove the relay as one piece. There is the possibility of harming the board or other components.

Comments and suggestions would be appreciated. 73, Bruce K6ZB

The Vox works from the side tone on CW so no sidetone, not vox. I just got back from Dayton and will see if I can help shortly, now that I see that it is an 820.

7719. Re: 6146B Tubes

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-23 18:47:52 UTC
From: Ellen R
Topic: 6191 Message: 7719

Hi Ron,

I'm writing this during a break at work. I've been busy the past few days, so I've been kind of quiet. Yeah, I'm beginning to think that my Ts-820 plate dip is pretty normal for the rig. If I remember right, the TS-520S I briefly had in college, and the TS-830S that W9YT (the Univ. of WI club station) had, didn't really give mega dips when tuning up. I guess I've been basing my expectations upon the last two tube rigs I owned, An FT-101B, and a set of Drake twins. Both of those used sweep tubes, so they probably dipped quite a bit more.

I'm pretty sure she's working fine. I'm just going to leave well enough alone. I get great signal reports, and I love the receiver. It's soooooo much quieter than my IC-703 Plus is. I plan on doing the CW edition of the CQ WPX this weekend. My IC-703 Plus is my contest machine (because of it's frequency agility), but I'm actually debating using my TS-820, QRP. Especially since I installed the 500 Hz CW filter in it a few weeks ago.. We'll see.

73,
Ellen - AF9J

Jody, don't be so sure that it's just a fuse. That's the first thing to go. If that's all that went, you're lucky. Even then, a blowing fuse can be sign of other problems. I have a Yaesu FT-221 all-mode I bought off of e-bay, that popped, and gave off smoke, the first time I tried it out, to see if it worked (hey, I got it cheap for about 130 dollars, without a mic or power cord). It turned out there was a short across the reverse polarity protection diode, that took out one o=f the circuit board traces, the pass transistor, and the bridge rectifier. Luckily it only cost $10 worth of parts to fix things.

Nevertheless, you may want to check power supply related things. BE CAREFUL. Some of the voltages are several hundred volts.

7721. TS820S Output Problem?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-23 19:05:31 UTC
From: Stephen Davis
Topic: 7721 Message: 7721

Hello All,

Thanks to this great group of people and to the problem Gordon resolved with his 820S, I now have bias on my TS-820S! Similar type of problem as Gordon's in that it was a flakey relay board connector. Now that I have bias, I can tune up the radio.... However, looks like there still might be a problem (Darn!). I tuned the radio on 40 meters and got 100 watts out, but when I checked the LP current, the needle was pegged. I quickly reduced carrier to get the recommended 200 milliamps, but that reduced my output to about 5 watts.

Any thoughts on what might be causing this would be appreciated.

Thanks and 73

Steve K7QHU

Hi Steve, I ahve a TS-820. LP? I assume you mean IP (plate current?). Did you check the Plate Idle Current? The procedure's listed in the manual. Basically, put the mode switch in LSB, and switch the meter reading to IP. It should only read 60ma. It sounds like your idle current (which is also your bias current) is way too high. To adjust it to 60mA, go to the back panel of the radio. There's a bias adjustment POT in the lower corner, near the SO-239 antenna plug (it's protected by a cap screw you have to remove). Turn this pot to adjust your idle current to 60mA.

Topic: 7721 Message: 7723

Hi Ellen,

Oh I hate typos. Yes, I did mean the IP current. I followed the procedure for setting the bias and it is at 60mA when the mode switch is in LSB and the meter is in the IP position. When I tune the radio, in order to get 100 watts out, I have to turn the carrier control up to the number six position on the dial. Then, when I turn the meter switch to the IP setting, the needle is pegged at 350mA. If I back the carrier control back down to the number 2 position, it reduces the IP to the recommended 200 mA level, but my output falls to about 5 watts. I am tuning the radio using a dummy load. I think something is amiss!!

Thanks for your help.

Steve K7QHU

Basically, put the mode switch in LSB, and switch the meter reading to IP. It should only read 60ma. It sounds like your idle current (which is also your bias current) is way too high. To adjust it to 60mA, go to the back panel of the radio. There's a bias adjustment POT in the lower corner, near the SO-239 antenna plug (it's protected by a cap screw you have to remove). Turn this pot to adjust your idle current to 60mA.

73,
Ellen - AF9J

7724. Re: [TS-520_820_530_830] Replacing RL1 Relay

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-23 21:03:44 UTC
From: Bill Scurlock
Topic: 7715 Message: 7724

Hi Bruce. When I removed the bandswitch wafers from their PC board, I used a combination of a solder sucker, and then the wick type of solder remover. It worked very well. My solder sucker was a gift from my wife, and a very simple one from Radio Shack. The tip gets hot to melt the solder, there is a round hole in the hot tip that slips over the wire end, and there is a simple squeeze bulb to suck out the solder. Then, in some cases, I used the wick type of remover with my solder iron to remove some remaining solder. Some of the connections just fell out of the hole, and some of them had to be gently pushed to break them loose. With some patience you should be able to remove the relay with no damage to the board.

I also experienced problems with the RL1 relay, but was able to cure it by removing the plastic cover and using DeOxit on a thin piece of stiff paper to slip between the contacts and clean them.

Good luck with your project.

Subject: [TS-520_820_530_830] Replacing RL1 Relay

I'm looking for advice on how to replace the RL1 relay on the AF board
of the TS-830. I've ordered a new one from East Coast Transistor, and
was told it would take 3 weeks for the relay to get to me.

The relay is soldered into the board at several places. So, I guess I
need to heat each connection and then suck the solder out. I would then
remove the relay as one piece. There is the possibility of harming the
board or other components.

Comments and suggestions would be appreciated. 73, Bruce K6ZB

Bill, thanks. I'll visit RadioShack for that gadget (I've got the old fashioned solder sucker).

I followed that procedure with DeOxit and the card, but it was a disaster for me. I apparently either spread the reeds too far or possibily melted some of the plastic with the solvent.

7726. [TS-520_820_530_830] Available 6146 tubes.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-23 23:01:45 UTC
From: Walt Breining
Topic: 7726 Message: 7726

I was at the Dayton Hamfest and talked to RF Parts. They have matched pairs of Sylvania-ECG/Phillips 6146 tubes. These are labeled Phillips 6146 W. These appear to be from Sylvania's last run and are really 6146 B tubes according to RF Parts. They showed me the construction difference between the olde W tubes and the ones that they had. They has extra clamps holding the top mica insulator and a much bigger filament support.

In view of the fact that the later 6146 W tubes were actually B series, and the appearance of these tubes, I believe them. RF Parts warrants them for 1 year and sells them for $59.90 plus shipping for a matched pair (2 tubes for $59.90).

I have not tried them, but if I needed some right now, this would be the way I would go.

Subject: [TS-520_820_530_830] BIAS and maybe output problem !!

By means of a small soft brush and a vacuum cleaner I have just
finished my cleaning inside my TS-520. I have also with spirits
lightly and carefully cleaned both dusted vacuum tubes - S2001.Then I
removed one bad pilot light and replaced all covers.

After switching my TS-520 on at first I would check current bias
setting. But no response. I check my steps and tryied again. The same
result. Meter pointer - no response. What did happen?
(sorry my english)

Thanks for help. Ivo

Check the cathode resistors on the 6146 tubes. They are probably bad. If you need more help doing so write back and I will go into more detail after I recover from Dayton.

Subject: [TS-520_820_530_830] TS820S Output Problem?

Hello All,

Thanks to this great group of people and to the problem Gordon resolved with his 820S, I now have bias on my TS-820S! Similar type of problem as Gordon's in that it was a flakey relay board connector. Now that I have bias, I can tune up the radio.... However, looks like there still might be a problem (Darn!). I tuned the radio on 40 meters and got 100 watts out, but when I checked the LP current, the needle was pegged. I quickly reduced carrier to get the recommended 200 milliamps, but that reduced my output to about 5 watts.

Any thoughts on what might be causing this would be appreciated.

Thanks and 73

Steve K7QHU

Yes Check R2 and R3. They are both 10 Ohms but are in Series so will ohm out at 5 ohms in the Circuit.

Also Check the IP meter resistor R4 it should read 3.3K . Mine was bad. I had to replace it.

Gordon

7730. VFO-820 not working with TS-820S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-23 23:50:06 UTC
From: ve1idx
Topic: 7730 Message: 7730

Good day gentlemen (and ladies I'm sure). My name is Garth and I just joined the group.Forgive me for asking if this has already been asked before but trying to look through ALL 7000+ post has my eyeballs hanging out. I have just aquired the rig I have been wanting for 25 years.It is a TS-820S in MINT condx with no scratches or rub marks anywhere.It truley looks as if it just came out of the box except for a slightly faded HV scale on the meter.It still has the original 12BY7 driver and S2001A finals which still put out 125 watts on the top of 10m and 150 watts on 80m and 160m.I also got the VFO-820 in similar condx and an MC-50 as well.I did have to adjust the speech processor freq response as it was way too sharp sounding but I still have one little problem and I wonder if anyone can help point me in the right direction.The previous owner plugged the VFO into the radio when the power was on and now the external VFO will not work.The rig will work with the internal VFO while the external unit is plugged in instead of a shorting plug.The VFO dial lights and the VFO and RIT LED's light up with the function switch in the appropriate positions but the radio will not operate from the VFO-820.It appears that the VFO is operating and generating the proper freq. but I am not sure how the radio switches between the two VFO's.I am suspect that the previous owner may have blown the 9v supply as I could only find 6v in the VFO-820.The kids were getting home from school and my eyes were starting to fail so I gave up on it today and thought I would see in anyone has had a similar problem and could give me a fresh starting point. I will follow up on the suspect voltage issue but just how does the radio switch between the internal and external VFO like in a split operation? I love this radio but would love it even more if I could work those DX stations on 20m split. :)

Hi Walt,

Those are the 6146s I bought from RF parts. I can't complain. I figured that since they're milspec, they'd last a bit longer. I'm glad I bought them. They make those chinese tubes I bought look like pieces of junk.

73,
Ellen - AF9J

Speaking of tubes....Someone told me that in the 820S, if you made a change of the 6146 tubes to another number or type, you can get more out of it. Any truth to this? And if so, does the 12BY7 tube have to be changed also?

Which is why, when I get the right packing materials together, I'm going to send the radio off to Byron Campbell. From what I've read on the Eham reviews page of Byron's repair business, he's an expert at getting these types of radios working again. If he charges me, say, $200 for a complete going over of the radio and getting it working again, I'll still only have a little over $300 into a radio that, from all reports I've heard, is a rock solid performer, albeit not as advanced as today's rigs. But hey, I'm on a budget, so I'll make do.

Thanks for the advice, though!

Sincerely,

Jody

Gordon:

On your TS 820, on the IF board, there is a plug labeled IF 1. Pin 6 is labeled CLB. This leads to L5 on the IF board. With the rig keyed up on SSB, there should be voltage there when the processor is on. No voltage when the processor is off. I think it should be around 9V. Please check this.

Please also tell me if you can hear your voice on SSB transmit through the speaker or headphones with the processor off and the Mon switch on. In other words, is the monitor function working on SSB?

Hi Garth

Welcome to this Group.

Do you have checked the cable between TRX + VFO for some loose cables. I hade the same problem on EVERY connection cable with ny VFO-520S + TS-520S. Always some "brocken" wires.

Daniel, HB9DDS

If R2 and R3 are in series, wouldn't the result be 20
ohms?

All,

Thanks Gordon, Walt, and all. You were correct, the problem was with the IP meter resistor. Funny thing, in examining the board initially, I saw the burned resistor, but because of the shape and color that it took, I thought it was a diode! I remember thinking "what is a diode doing there" and meaning to check the schematic later, but never got around to it. After receiving your advice, I was looking for the resistor on the board and finally realized that the "diode" was were R4 should be. I then took a close look at it and realized it was R4 all burned up. All I could do was shake my head and laugh!! Replaced the resistor and the meter started working much better. My bias was low, so I cranked it up to 60mA and now my output is around 100 watts.

The meter still acts "twitchy" and I do not get any motion from the needle in receive mode. It stays all the way to the left (0db) and does not indicate the strength of the incoming signals. Still some more troubleshooting to do. I guess whatever took out the resistor may have done other mischief. For now, I am going to put the covers back on and give it a try on the air. Hooray!!

Thanks

Steve K7QHU

Yes Check R2 and R3. They are both 10 Ohms but are in Series so will ohm out at 5 ohms in the Circuit.

Also Check the IP meter resistor R4 it should read 3.3K . Mine was bad. I had to replace it.

That is GREAT Steve.
The only LOAD on that resistor would be the Meter itself and I would think that the Meter would fry before that resistor would. Mine was Reading way too high in resistance.. Perhaps something shorted out between it and the Meter. I would check the wiring around the Meter select switch. Perhaps there is something there to prevent the S meter from working also.
Keep us Posted.

Steve,
If you have the AGC "OFF" the S meter will NOT show any movement.

Gordon,

The AGC is on, but still no go. Yeah, the resistor was burned and thus a short rather than an open. After I use the radio tonight, I will take another look around the meter circuitry.

Thanks again for all your help.

Steve

Steve,
If you have the AGC "OFF" the S meter will NOT show any movement.

Hi Walt,
Ok, I checked IF 1 Pin 6. When I key up on SSB with the Processor
on, I get 9 volts on this wire and 0 volts when it is Off. Also, Yes,
I can hear myself when The Minoitor is On .

73,
Gordon

7749. New Member Here

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-25 00:38:01 UTC
From: w6aws
Topic: 7749 Message: 7749

Greetings to all,

I am new here. I am scheduled to take both elements 1 and 3 on the 17th of June.

I am currently putting together a TS-830s station together. Having fun in the search for the components.

Still need an SP-230 and VFO-230. If anyone here has either and want's to part with em, let me know.

Looking forward to learning alot about the TS-830s and accessories on this site. I do enjoy the post's.

73,

Andy

7751. Original Paint

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-25 02:52:49 UTC
From: Gordon
Topic: 7751 Message: 7751

Now that I have resuurected this old 820S, I need to repaint the surface rusted cabinet. I'll probably get the case glass beaded and then repaint it to look as good as new (I hope)
Anyone know Where I can Get the EXACT color to paint it with? I think I saw some Kenwood paint on ebay last month.. Is that stuff any good ??
I wish the case on this 820 was half as good as the Original paint on my 830 and I wouldn't have to worry about it.

BTW, Just ordered a New TS-2000S today. I should have it Tomorrow so I can play in the WPX contest with it. I'm Excited!!
73,
Gordon

I'd say take the panel off and hand it to the paint matcher at a Home Depot (or such). They should be able to get an exact match.

Ellen, I'm a N6 not very rare. You however have a Huge advantage in
that department An AF9 Yes, That's a good one !

So, I need a new Rig and more Power with a Bigger Antenna just to
level the playing field ;-)

73,
Gordon

7755. Re: Replacing RL1 Relay

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-25 16:40:09 UTC
From: belbert2002
Topic: 7715 Message: 7755

This matter is now completely resolved. It turns out that the Remote connection to the linear works after all. I was confused by the manner in which RL1 provides contact closure - which is not a clean contact closure but rather runs through various circuit components before reaching the Remote connector on the back. I does key the linear effectively, although I would look into using an aux circuit as suggested by others.

My relay problem was bent contacts on RL1, which happened when I removed the plastic cover. By removing RL1 from the board (thanks Bill - K5GCW - that Radio Shack solder sucker did the trick) I could then remove the plastic base and carefully bend the reeds into place. Upon resoldering the relay, things worked perfectly.

The rig works wonderfully on SSB with the linear and there is no need to use the ALC. I checked this with my IC 756 PRO2 on audio and the spectrum scope.

Agreed, but you'll still have me in the antenna & power department.
I sure hope 10 & 15 open up. Because my antenna really plays on
those bands.

I hope ALL the bands open up. Actually, I hope I can run into you.
That would be really cool. I'm waiting for the UPS guy right now.
So anyone know where to get some Exact Matching Paint?
I don't think Home Depot is going to have the EXACT kenwood match in a
spray can hihi

Hello,

My TS-820S and accessories (speaker, VFO and transverters) all have a textured finish. It would seem that matching the color is fairly easy but can the texture of the finish be matched?

Thanks,

George KC1V

I'd say take the panel off and hand it to the paint matcher at a Home
Depot (or such). They should be able to get an exact match.

You have a VERY good point there. I'll have to ask my buddy that is a professional Painter for cars if he can tell HOW to get the Texture effect.
Thanks for bringing that up. I also noticed that the Texture only seems to be on the Outside of the case. The inside is the same color and smooth in appearance.

Gordon

7761. Replacing TS-820 Filter Capacitors

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-25 23:11:25 UTC
From: Stephen Davis
Topic: 7761 Message: 7761

Hello All,

I ordered replacement filter capacitors for my TS-530. They have arrived, but they are quiet a bit smaller in diameter than the originals. Small enough to drop through the mounting holes. Also I don't think the clamps will fit them. Does anyone have any suggestions on how to mount these? I scoured the net for physically larger capacitors of the same capacitance and voltage but could not find any. As a solution to the problem, I was thinking of trying to find a washer big enough for the capacitor to fit through at Home Depot. I would glue the washer to the chassis, slip the capacitor in and secure it with the clamp. Sounds kinda kludgey, but I think it might work. Any thoughts?

The next challenge is that the original capacitor had two prongs for soldering at each terminal. The replacement only has one prong. It is going to be tough to solder everything to the single terminals. Any method for extending the terminals? I thought of soldering an extension wire, but I think that would come unsoldered from the terminal as I try to solder the components and connecting wires to it. Seems like all of this is prone to error. I have limited experience in troubleshooting and repairing radios so any suggestions would be welcome.

I sure am glad this group exists!

Steve K7QHU

textured finish
that can be reproduced but not with the handy spray cans
it is known as orange peel have it done professionally at the local car
spray shopand give them a sample of what you want done
and also it will haft to have a matting agent added to the paint other wise
you will land up with high gloss what creates the orange peel affect is
the paint not been thinned down quite as much what happens when you spray
it on the paint starts to dry before it has completely flattened out
leaving that orange peel affect do not use pressure pack sprays if you
want that orange peel affect the paint in the cans is too thin to
reproduce the affect

Unless you're hoping to maintain stock color for those that like it
should you sell it, why not be a little creative? I would think, oh,
camouflaged or even a copper infused paint (to futher shield rf in and
out). Since the rigs weigh so much, maybe a stone texture paint!

hi hi

7767. Re: [TS-520_820_530_830] Re: Speech Processor in the TS-820 s

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-26 10:47:05 UTC
From: Walt Breining
Topic: 7767 Message: 7767

Re: Speech Processor in the TS-820 s

Gordon:
I think I understood that you got the sidetone working but the speech processor is still dead. You get transmit on SSB with the processor off but loose it when the processor is on no mater how high you turn the compression level control.

The Processor circuit is on the IF board.
This processor is a RF processor as it does the compressing at an RF frequency rather than a audio frequency. It does, not work in the IF but instead converts the audio to a sideband signal at a frequency of 455 kHz, compresses it as RF and then converts it back to audio. The theory is that by doing this, the 455 kHz filters will remove the harmonic distortion caused by hard limiting. When the processor is on, Q-22 amplifies the audio and drives a balanced modulator. For the balanced modulator to function it must be supplied a 455 kHz carrier signal. This comes from carrier oscillator Q-28 and Q-29. The 455 kHz carrier signal is on TP-1 and is applied to the balanced modulator through C-130. It is also supplied to a product detector, by way of C-133. After this process is complete, the product detector returns the signal to an audio frequency. If you have a scope available, please let me know. Otherwise measure the voltages on Q-28 and Q-29, and then Q-23, Q-24, and Q-25. This should be done with the radio in SSB transmit and the processor on.

If the circuit is not getting the carrier oscillator signal, it will not pass audio from input to output. Also check the small filters, CF-1, CF-2, CF-3 for bad solder connections. Let me know what you find and we can go from there.

Subject: [TS-520_820_530_830] Re: Side Tone Circuit in TS-820S

Hi Walt,
Ok, I checked IF 1 Pin 6. When I key up on SSB with the Processor
on, I get 9 volts on this wire and 0 volts when it is Off. Also, Yes,
I can hear myself when The Minoitor is On .

73,
Gordon

The best tubes for the 820S are the S-2001 tubes it originally came with. The 6146B type are almost as good. There is no magic tube that will give your rig more output. There has been a mod floating around that involves changing the screen voltage among other things and will slightly increase the output but runs the tubes, many of the components, and the transformer to death. I highly recommend against it. Remember, these rigs have some age on them.

Lets put this in perspective. If you double your power, you gain 3 dB. 6 dB is an S unit. So doubling your power is 1/2 an S unit. Now the power increase does not double your power, it increases it by less than one third. So this will only be noticed on your watt meter, and would never be seen at the receiving end. The price you pay to see the watt meter read slightly higher is shortened tube life, shortened life of the rig, more intermodulation distortion.

If you want a meaningful increase in your signal, there are much better ways. The way to get a real power increase is to get an amplifier. If I knew your set up, I might be able to recommend ways to improve your antenna efficiency for an improvement greater than hot rodding the rig can give you. Depending on what mike you are using, increasing your audio response and duty cycle can increase your strength to the listener's ear.

One of the advantages of the TS-820 and similar Hybrid Kenwood rigs is that they do not run the tubes to death as does the Yaesu FT-101. My TS-820 still has the original S-2001s in it.

Your TS-820 is a fine rig that will probably give you years of good service. Don't destroy it with mods that will be meaningless on the air.

I love my TS-820.

Speaking of tubes....Someone told me that in the 820S, if you made a change
of the 6146 tubes to another number or type, you can get more out of it. Any
truth to this? And if so, does the 12BY7 tube have to be changed also?

Subject: RE: [TS-520_820_530_830] Re: TS820S Output Problem?

All,

Thanks Gordon, Walt, and all. You were correct, the problem was with the IP meter resistor. Funny thing, in examining the board initially, I saw the burned resistor, but because of the shape and color that it took, I thought it was a diode! I remember thinking "what is a diode doing there" and meaning to check the schematic later, but never got around to it. After receiving your advice, I was looking for the resistor on the board and finally realized that the "diode" was were R4 should be. I then took a close look at it and realized it was R4 all burned up. All I could do was shake my head and laugh!! Replaced the resistor and the meter started working much better. My bias was low, so I cranked it up to 60mA and now my output is around 100 watts.

The meter still acts "twitchy" and I do not get any motion from the needle in receive mode. It stays all the way to the left (0db) and does not indicate the strength of the incoming signals. Still some more troubleshooting to do. I guess whatever took out the resistor may have done other mischief. For now, I am going to put the covers back on and give it a try on the air. Hooray!!

Thanks

Steve K7QHU

Yes Check R2 and R3. They are both 10 Ohms but are in Series so will ohm out at 5 ohms in the Circuit.

Also Check the IP meter resistor R4 it should read 3.3K . Mine was bad. I had to replace it.

Well seen and well done, Walt.

I have also a TS-820 running with the original S-2001 tubes giving an output power of 130 watts on a 50 ohm dummy load ! Still using the rig on regular basis on the air, although I have also modern rigs as a TS-870 and a Yeasu R-1000 ! But what a pleasure to tune a 820 and to refresh the brains on our it really works !

The cheapest, and most effective way to increase your on the air signal, is just basic antenna improvements. Even something as simple as putting in newer/better feedline can add a dB or 2 to your signal. More antenna height will also help. Trying to get another 15 or 20 watts by modding the rig is a waste of time. Not only will it run harder, but like a modded guitar amp, will be more susecptable to distortion, run hotter, and components will have a shorter lifespan.

Like Walt said, one of the things that makes our rigs cool, is that the finals are not beeing pushed way past design limits. You can't say this about rigs like the FT-101, the Drake's, and the Swan's, that will kill their finals in no time at all, if they are not tuned up properly. This is because they use TV sweep tubes, which were never intended for RF applications. Yeah, they can handle the power loads..... but they don't like it. 20 years of life from the original 6JS6c's - yeah, maybe if the rig was hardly ever used. 6146s with 20 years of life - sure, just treat them right. I still have the 6146Bs that came with my 820. They're down quite a bit on power (I can get maybe 45 watts out of them), but they're still good enough for use as backup/disaster tubes. When sweep tubes go, toss them, because they're usually toat.

73,
Ellen - AF9J

You can do like many restorers do. Put the new cap into the older can that has been emptied out. Its not that complicated to empty the older can and you will end up with an original looking rig!
Peter VE2FAR

Stephen Davis <sdavis@...> wrote: Hello All,

I ordered replacement filter capacitors for my TS-530. They have arrived, but they are quiet a bit smaller in diameter than the originals. Small enough to drop through the mounting holes. Also I don't think the clamps will fit them. Does anyone have any suggestions on how to mount these? I scoured the net for physically larger capacitors of the same capacitance and voltage but could not find any. As a solution to the problem, I was thinking of trying to find a washer big enough for the capacitor to fit through at Home Depot. I would glue the washer to the chassis, slip the capacitor in and secure it with the clamp. Sounds kinda kludgey, but I think it might work. Any thoughts?

The next challenge is that the original capacitor had two prongs for soldering at each terminal. The replacement only has one prong. It is going to be tough to solder everything to the single terminals. Any method for extending the terminals? I thought of soldering an extension wire, but I think that would come unsoldered from the terminal as I try to solder the components and connecting wires to it. Seems like all of this is prone to error. I have limited experience in troubleshooting and repairing radios so any suggestions would be welcome.

I sure am glad this group exists!

Topic: 7767 Message: 7773

Thanks Walt,
Wow, you sure do know these 820's well.
I'm going to work the WPX contest this weekend, So I will dive back into the 820's speech processor first of next week.

Thanks Again,
Gordon

> I think I understood that you got the sidetone working but the speech processor is still dead. You get transmit on SSB with the processor off but loose it when the processor is on no mater how high you turn the compression level control.
>
> The Processor circuit is on the IF board.
> This processor is a RF processor as it does the compressing at an RF frequency rather than a audio frequency. It does, not work in the IF but instead converts the audio to a sideband signal at a frequency of 455 kHz, compresses it as RF and then converts it back to audio. The theory is that by doing this, the 455 kHz filters will remove the harmonic distortion caused by hard limiting. When the processor is on, Q-22 amplifies the audio and drives a balanced modulator. For the balanced modulator to function it must be supplied a 455 kHz carrier signal. This comes from carrier oscillator Q-28 and Q-29. The 455 kHz carrier signal is on TP-1 and is applied to the balanced modulator through C-130. It is also supplied to a product detector, by way of C-133. After this process is complete, the product detector returns the signal to an audio frequency. If you have a scope available, please let me know. Otherwise measure the voltages on Q-28 and Q-29, and then Q-23, Q-24, and Q-25. This should be done with the radio in SSB transmit and the processor on.
>
> If the circuit is not getting the carrier oscillator signal, it will not pass audio from input to output. Also check the small filters, CF-1, CF-2, CF-3 for bad solder connections. Let me know what you find and we can go from there.

7776. Re: TS820S Output Problem? (Twitchy S-meter)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-26 20:29:55 UTC
From: Dimitri
Topic: 7721 Message: 7776

My S-meter has been twitchy .
Usually rurning RF gain all the way down would cause the meter to slowly "peg" to max and come to life for a few minutes. Then it would go out again.
It seemed like an intermittent connection and yesterday after opening it up I discovered it was the s-meter adjutment trimmer (VR-1) on the IF board. Cleaning it didn't have any effect. There seems to be a hole where the wipers sits (in just the right spot). Until I get a replacement, I just turned it down by 2 S units and now it works all the time.

Moral of the story....lower the asjustment of the S meter and see if the twitch goes away. If it does...replace VR-1 on the IF board

Actually, the finals in the Yaesu FT-101 are not run hard at all. They are 6JS6C tubes and are much larger than the 6146. In the Yaesu they are run at about 260 watts peak SSB input, whereas they are capable of at least twice that amount. They have a maximum current rating of 350 ma per tube continuous duty in tv service, which would be the approximate maximum rating for peak plate current in SSB service.

In a Galaxy V MKIII, (they are
a drop-in replacement for the original 6LB6) they will put out well over 300 watts (more than 500 watts peak input, just slightly less than the 6LB6). At this power level, assuming normal duty cyle for SSB transmission, they will be dissipating well under their rated 30 watts of plate dissipation. In the FT-101, the tubes will be practically loafing along with less than half that amount of plate dissipation. They usually last many years in that service.

Having said that, the 6146 is still a much better tube because it was designed for transmitting, rather than television service, even thought it is capable of only about half the power of a 6JS6C.

All,

I have an intermittent audio problem in cw. On returning to receive the audio sounds hollow and slighty higher in pitch. I believe this is a problem with a relay, or part of a relay getting stuck. Cycling the send switch or tapping the key usually clears this up. The only thing is that this sometimes happens if I switch from ssb to cw mode, not transmitting at all.

John,
I have the AT-180 Schematic in my Library, But have NOT found the
manual yet. I will keep an eye out for it.

7790. Convert MC-80 Mic to operate on a TS-830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-28 17:22:19 UTC
From: N3DOK
Topic: 7790 Message: 7790

Hi,
I have a Kenwood MC-80. I would like to use it with my TS-830S. Manual information of the MC-80 indicates that a Kenwood MJ-84 adapter is required. Since the MJ-84 is very hard to find, anyone know of a modification?

Thanks to everyone who keeps the Kenwood Hybrid rigs on the air! Kenwood TS-520, TS-520D, TS-520S, TS-520SE, TS-520SP, TS-820, TS-820S, TS-530S, TS-830S, R-820

The stuff I bought is made by CAIG Laoratories and is named Deoxit D5.
It cost about 15 bucks for a 5 oz can. It works GREAT! Just a little
bit does a fantastic job.

You could email them and find out if they have a distributor in Australia.
their website is: http://www.caig.com
EMAIL IS : caig123 at caig.com...

Thanks Daniel! I got it fixed. I was too concerned about what the previous owner told me had happened that I neglected to look at the obvious.That is quite embarrasing for a broadcast tech to admit. ;) Too much work and not enough sleep lately I guess. I found a broken wire in the connecting cable.A little spot of solder and I can now try to work VI9NI on split. ;)

This product is available in Austrlia - prices at the link below.
http://www.eav.com.au/caig-prices.shtml
Some amateur dealers (Ozgear in Brisbane for instance)list it on their websites.

7797. CW Filter YK88CN Installed

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-29 13:12:33 UTC
From: Ken Gunton
Topic: 7797 Message: 7797

I recently purchased a YK88CN 270-Hz filter,
and installed it in my TS-830S this weekend,
thinking I would try it out on the CQ WW WPX
contest. I had never before used a rig with
a narrow CW filter, having used an SB-102 since I
built it in 1969 without the optional filter.

WOW!!! is all I can say. By playing with the
VBT and Notch controls, I was able to single
out signals which, on wide CW mode, seemed
on top of each other. That, coupled with using
the phase reversal switch on my Heil Pro headset
(just bought at Dayton Hamvention), allowed
me to "see" or "feel" the signal I wanted to
listen to.

At first, I thought I had a dead filter, but
turning the VBT to the 2-3 o'clock position
brought everything to life.

If you operate CW without a narrow filter, you
have no idea what you are missing!

Just remember (I didn't-gulp) to change
the jumper next to the filter bank to the one
you're installing....makes all the difference
in the world... hi hi

7799. Looking for company that will refurbish non-working ts-520s

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-29 16:15:16 UTC
From: Jody Mills
Topic: 7799 Message: 7799

I was originally going to send my non-working 520s to Byron Campbell, wa4geg, as I had once spoken to him about this radio and was going to send it in. But, things got busy and I never got around to sending it in.

Today I decided, dang it I'm going to get this done! So I went to his webpage to get his email address, only to find that he now only lists Yaesu equipment as equipment he accepts for repair. I've emailed him to ask if he will, in fact, accept my ts-520s or if he has completely narrowed his focus to Yaesu products.

While I wait for a reply, I thought I would ask you folks if you know of any reputable repair facilities that will work on an old Kenwood boat anchor. Repairing it myself is not an option, as I am just barely scratching the surface of amateur radio and currently know nothing of electronics. In time, of course, I intend to remedy that, but for right now my main concern is getting a budget-conscious hf setup for my home up and running for when I pass the General later this year.

Thanks!

I previously owned a TR-7850, the higher power version of the same radio. There was no CTCSS generator built in. The front panel "Tone" button was simply a switch to enable/disable a user-installed tone transmit module.

Many of us used a Com-Spec deck. It had a DIP switch for setting one tone at a time. Here is an example of a current-production unit that is far smaller than the one I used: http://www.com-spec.com/ss64.htm. I installed mine in an external box and used a switch to select the tones.

7805. Bad Winter for the 820

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-29 22:45:37 UTC
From: Steve
Topic: 7805 Message: 7805

I switched my 820 on after a Winter in the shed and it didn't want to play!
At first switch on it would not tune on any of the bands and the digital counter kept counting with the last two digits around a set frequency.
After leaving it on for a while the 160,80 and 40m bands have come back to life leaving the higher bands still hunting and no reception.
The Mode doesn't affect the ailment and when I opened her up there were no obvious signs of damage or loose wires.
After I put it back I twisted the VFO switch a few times and got a temporary reprieve for all of 5 minutes before I lost reception again.
Has anyone in the group had similar experiences- I suspect a faulty connection because of the temporary reprieve- but I wouldnt know wher to start.
(The RF meter does register a signal from my TS50 when sent but no intelligible audio)

Steve;
Since it spent the winter in the "shed" and looking at the type of problems you are having, there is a good chance some contacts in the rig have corroded (unless the shed is high & dry and no possible moisture got to the unit ?). In any case, the first thing I would do is get some De-Oxit and clean all the switches (pay special attention to the band switch and mode switch) and pots and pull each of the connectors to the boards above and below the chassis cleaning the pins as you go (work the plugs and pins several times on & off to help the cleaning process). Also clean the relay sockets and any other sockets ie tube sockets, SO239, 9-pin socket for VFO etc. Corroded contacts just give you constant intermittent problems so best to just clean them all then see where the rig stands. Dirty or corroded relay contacts are also a source for intermittent transmit & receive problems so those should also be cleaned.

type of problems you are having, there is a good chance some contacts
in the rig have corroded (unless the shed is high & dry and no
possible moisture got to the unit ?). In any case, the first thing I
would do is get some De-Oxit and clean all the switches (pay special
attention to the band switch and mode switch) and pots and pull each
of the connectors to the boards above and below the chassis cleaning
the pins as you go (work the plugs and pins several times on & off to
help the cleaning process). Also clean the relay sockets and any other
sockets ie tube sockets, SO239, 9-pin socket for VFO etc. Corroded
contacts just give you constant intermittent problems so best to just
clean them all then see where the rig stands. Dirty or corroded relay
contacts are also a source for intermittent transmit & receive
problems so those should also be cleaned.

Start by cleaning all of the switches and controls with DE-Oxit. Be sure to clean the SG switch on the back and place it on on.

Subject: [TS-520_820_530_830] Bad Winter for the 820

I switched my 820 on after a Winter in the shed and it didn't want to
play!
At first switch on it would not tune on any of the bands and the
digital counter kept counting with the last two digits around a set
frequency.
After leaving it on for a while the 160,80 and 40m bands have come
back to life leaving the higher bands still hunting and no reception.
The Mode doesn't affect the ailment and when I opened her up there
were no obvious signs of damage or loose wires.
After I put it back I twisted the VFO switch a few times and got
a temporary reprieve for all of 5 minutes before I lost reception again.
Has anyone in the group had similar experiences- I suspect a faulty
connection because of the temporary reprieve- but I wouldnt know wher
to start.
(The RF meter does register a signal from my TS50 when sent but no
intelligible audio)

Topic: 7767 Message: 7811

Hi Walt,
I started to get into the Speech Processor today, But came upon something Strange and Interesting. There is Something Soldered to the Circuit side of the IF Board. It is some sort of add-on Board. I checked out the 4 wires that are attached to it, and they tie into the RF speech processor part of the IF board. I posted some Pictures of this Unit. It does NOT appear to be in my schematics at all.
Go to this link and look over the pictures if you could, and let me know what in heck this thing is. Has anyone ever seen one of these ? Perhaps it is why my speech processor does Not work.
Link: http://www.n6wk.com/kenwood/820S/

1 wire ties into TP 4 on the IF board next to Q24,
the next wire ties into R113 R138 and R108, the Next ties into C39 and R140 and the last ties into D39, D40 and C133
I tried to take a close up picture of the Circuit side to help you.

73,
Gordon

> I think I understood that you got the sidetone working but the speech processor is still dead. You get transmit on SSB with the processor off but loose it when the processor is on no mater how high you turn the compression level control.
>
> The Processor circuit is on the IF board.
> This processor is a RF processor as it does the compressing at an RF frequency rather than a audio frequency. It does, not work in the IF but instead converts the audio to a sideband signal at a frequency of 455 kHz, compresses it as RF and then converts it back to audio. The theory is that by doing this, the 455 kHz filters will remove the harmonic distortion caused by hard limiting. When the processor is on, Q-22 amplifies the audio and drives a balanced modulator. For the balanced modulator to function it must be supplied a 455 kHz carrier signal. This comes from carrier oscillator Q-28 and Q-29. The 455 kHz carrier signal is on TP-1 and is applied to the balanced modulator through C-130. It is also supplied to a product detector, by way of C-133. After this process is complete, the product detector returns the signal to an audio frequency. If you have a scope available, please let me know. Otherwise measure the voltages on Q-28 and Q-29,

and then Q-23, Q-24, and Q-25. This should be done with the radio in SSB transmit and the processor on.
>
> If the circuit is not getting the carrier oscillator signal, it will not pass audio from input to output. Also check the small filters, CF-1, CF-2, CF-3 for bad solder connections. Let me know what you find and we can go from there.

Hi Dennis
Thanks for the advice from yourself and the other folk.
Just to make an ass of me the old girl has decided to play again
tonight and has spent more time behaving than not!
I did lube the switches last night and left them and this seems to
have helped although she is still 'touchy' when moved.
All this would tend to agree with the bad contact diagnoses so I
will take all your great advice and give her a good going over.
I guess she's got rheumatics and will have to spend next Winter
some where warmer and dryer....perhaps the cow shed !!!
(All that methane is probably less corrosive than the North Sea air)
Thanks again,
Steve M1SPY.

Steve;
Yep, that's just the way they react to dirty contacts, something works today then fails tomorrow or something doesn't work today but works tomorrow. As you flip the various switches and turn the pots trying to see what is working, sometimes they make good contact the next not so good. A good cleaning will save you alot of frustration. Methane may not be corrosive but the smell makes it uncomfortable to operate the rig, plus the finals may really light up HiHi!!!!

7818. TS-530S Sudden Low Power - Update

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-05-31 01:40:30 UTC
From: Stephen Davis
Topic: 7818 Message: 7818

Hello All,

A week or so ago, I posted a problem to the group that concerned my TS-530S suddenly loosing about half its power and getting ripple on my CW output. The diagnosis was a bad power supply filter cap. I ordered replacement caps and this weekend replace the existing caps with the new ones. I hollowed out the old filter caps and place the new caps inside the old cans. That worked like a charm. Wired them up and did a smoke test and everything is working great and I am back up to full power with no ripple on my CW output. Hooray!!!

Thanks to everyone who assisted me in trouble shooting this problem.

So, while I still have it opened up, I have a question. The microphone receptacle on the front panel is loose. Not finding a nut on the back side to tighten, I am guessing the nut is between the face plate and the front of the chassis. Can anyone confirm this? If so, what are the gotcha's to look out for in removing the faceplate. I am particularly worried about the VFO knob and dial assembly. I would love to tighten up the microphone receptacle, but not at the risk of screwing up the VFO or something else.

Thanks

Steve K7QHU

Subject: [TS-520_820_530_830] TS-530S Sudden Low Power - Update

Hello All,

A week or so ago, I posted a problem to the group that concerned my TS-530S suddenly loosing about half its power and getting ripple on my CW output. The diagnosis was a bad power supply filter cap. I ordered replacement caps and this weekend replace the existing caps with the new ones. I hollowed out the old filter caps and place the new caps inside the old cans. That worked like a charm. Wired them up and did a smoke test and everything is working great and I am back up to full power with no ripple on my CW output. Hooray!!!

Thanks to everyone who assisted me in trouble shooting this problem.

So, while I still have it opened up, I have a question. The microphone receptacle on the front panel is loose. Not finding a nut on the back side to tighten, I am guessing the nut is between the face plate and the front of the chassis. Can anyone confirm this? If so, what are the gotcha's to look out for in removing the faceplate. I am particularly worried about the VFO knob and dial assembly. I would love to tighten up the microphone receptacle, but not at the risk of screwing up the VFO or something else.

Thanks

Steve K7QHU

Hello,

I actually purchased from Newark In One (www.newark.com). They had no handling charge and same day shipment. Great service. The sku# is 95F4424. The part was a United Chemicon Aluminum Electrolytic Capacitor: 100uf, 500v. You can go to the web site and enter the SKU# in the search by part number. They cost $2.84 apiece.

Hi Dennis
Thanks for the advice from yourself and the other folk.
Just to make an ass of me the old girl has decided to play again
tonight and has spent more time behaving than not!
I did lube the switches last night and left them and this seems to
have helped although she is still 'touchy' when moved.
All this would tend to agree with the bad contact diagnoses so I
will take all your great advice and give her a good going over.
I guess she's got rheumatics and will have to spend next Winter
some where warmer and dryer....perhaps the cow shed !!!
(All that methane is probably less corrosive than the North Sea air)
Thanks again,
Steve M1SPY.

<windled@...> wrote:
>
> Steve;
> Since it spent the winter in the "shed" and looking at the
type of problems you are having, there is a good chance some contacts
in the rig have corroded (unless the shed is high & dry and no
possible moisture got to the unit ?). In any case, the first thing I
would do is get some De-Oxit and clean all the switches (pay special
attention to the band switch and mode switch) and pots and pull each
of the connectors to the boards above and below the chassis cleaning
the pins as you go (work the plugs and pins several times on & off to
help the cleaning process). Also clean the relay sockets and any
other sockets ie tube sockets, SO239, 9-pin socket for VFO etc.
Corroded contacts just give you constant intermittent problems so
best to just clean them all then see where the rig stands. Dirty or
corroded relay contacts are also a source for intermittent transmit &
receive problems so those should also be cleaned.

Topic: 7767 Message: 7822

What this is the olde W6TOG speech processor mod that turns the speech compressor into a clipper. It is not without merit. I have wanted to get a look at one, reverse engineer it, and analyze it's merits for quite some time. Unfortunately the mod itself has been tampered with in your rig. Hence the pot and the series resistor to TP. I would remove it for now and go back to the original circuit..

The power - is supplied by the solder connections to the ground foil to the IF board that mounts it.

1. The blue/Grey that goes to 14V can be removed as it is the power source. I think that this the wire that goes to R113, R138, and R 108.
2. The wire that goes to TP4 is the clipper input. Remove it
3. The wire that goes to C- 139 and R-140 is the clipper output. Remove it
4. The wire that goes to C-133 D39 and D40 is the source for the compression meter position of the multimeter. It also is the reference for the compressor gate that probably has been defeated by removal of R-105 and R-110. Remove it.

Now you will have some parts missing from the IF board where the input, output, and meter connections were made.

Around TP 4 check to see if C-133, c-139, and c140 are there.
See if R-110 is missing at the base of Q 24. See if R-105 is missing from the base of Q 23.

Check all components associated with Q-23, Q-24, and Q-25, also around Q 26 and Q 27 for any missing components. Replace any missing parts.

After doing the above, see if the processor works. If not, measure the voltages on these transistors and get back with me.

Subject: [TS-520_820_530_830] Re: Speech Processor in the TS-820 s

Hi Walt,
I started to get into the Speech Processor today, But came upon
something Strange and Interesting. There is Something Soldered to the
Circuit side of the IF Board. It is some sort of add-on Board. I
checked out the 4 wires that are attached to it, and they tie into the
RF speech processor part of the IF board. I posted some Pictures of
this Unit. It does NOT appear to be in my schematics at all.
Go to this link and look over the pictures if you could, and let me
know what in heck this thing is. Has anyone ever seen one of these ?
Perhaps it is why my speech processor does Not work.
Link: http://www.n6wk.com/kenwood/820S/

1 wire ties into TP 4 on the IF board next to Q24,
the next wire ties into R113 R138 and R108, the Next ties into C39
and R140 and the last ties into D39, D40 and C133
I tried to take a close up picture of the Circuit side to help you.

73,
Gordon

speech processor is still dead. You get transmit on SSB with the
processor off but loose it when the processor is on no mater how high
you turn the compression level control.
>
> The Processor circuit is on the IF board.
> This processor is a RF processor as it does the compressing at an RF
frequency rather than a audio frequency. It does, not work in the IF
but instead converts the audio to a sideband signal at a frequency of
455 kHz, compresses it as RF and then converts it back to audio. The
theory is that by doing this, the 455 kHz filters will remove the
harmonic distortion caused by hard limiting. When the processor is on,
Q-22 amplifies the audio and drives a balanced modulator. For the
balanced modulator to function it must be supplied a 455 kHz carrier
signal. This comes from carrier oscillator Q-28 and Q-29. The 455 kHz
carrier signal is on TP-1 and is applied to the balanced modulator
through C-130. It is also supplied to a product detector, by way of
C-133. After this process is complete, the product detector returns
the signal to an audio frequency. If you have a scope available,
please let me know. Otherwise measure the voltages on Q-28 and Q-29,
and then Q-23, Q-24, and Q-25. This should be done with the radio in
SSB transmit and the processor on.
>
> If the circuit is not getting the carrier oscillator signal, it will
not pass audio from input to output. Also check the small filters,
CF-1, CF-2, CF-3 for bad solder connections. Let me know what you find
and we can go from there.

Jody Mills <jody.mills@...> wrote:
I was originally going to send my non-working 520s to Byron Campbell, wa4geg, as I had once spoken to him about this radio and was going to send it in. But, things got busy and I never got around to sending it in.

Today I decided, dang it I'm going to get this done! So I went to his webpage to get his email address, only to find that he now only lists Yaesu equipment as equipment he accepts for repair. I've emailed him to ask if he will, in fact, accept my ts-520s or if he has completely narrowed his focus to Yaesu products.

While I wait for a reply, I thought I would ask you folks if you know of any reputable repair facilities that will work on an old Kenwood boat anchor. Repairing it myself is not an option, as I am just barely scratching the surface of amateur radio and currently know nothing of electronics. In time, of course, I intend to remedy that, but for right now my main concern is getting a budget-conscious hf setup for my home up and running for when I pass the General later this year.

Thanks!

Hi Walt,
Ok, I carefully unsoldered the wires at the IF board from this
little unit. After getting it disconnected, I see labels on it for
C139, C133, TP, and 14V also a GND.
I checked the IF board for missing components. C139 is missing
along with C133. The resistors you mentioned are there. I also
noticed that it appears as if C23 was NEVER installed on this Board.
Is that Common?
I will replace the missing caps today and get back to you.
Do you want this Little unit to play with walt? I have No use for it.
73,
Gordon

Hi James,

The Digikey P7453-ND capacitor has a diameter of 35mm. The original capacitor (at least in my radio) has a diameter of about 42mm. The replacement I used had a diameter of 25mm and once the old capacitor can was cleaned out (a messy, time consuming job) the new capacitor fit inside very nicely. Although I was leery of this solution at first, I am really happy with the results. Despite the new capacitors, the radio retains the original appearance.

hi,

In the database section, the table PARTS has
data for replacement parts.

HV Caps from digikey are same diameter
as the OEM, just a bit shorter in height.

DIGIKEY P7453-ND

Hi Bob,

Thanks for the info. I always figured that since they weren't designed for transmitting applications, that they were being pushed hard, when they wer being used foor transmitting. Hmmm, you learn something new everyday.

73,
Ellen - AF9J

P.S. - did my card arrive in the mail to you?

You're welcome Ellen,
The key to using sweep tubes (and any tubes) is quick and proper tuning. The two 6LX6 tubes in my linear amp have been there for eleven years and are still like new.
I received the card. Thanks!

Walt and Group,

I replaced the missing C139 and C133 Caps. Fired up the rig and Presto
The Processor now works.
I am curious. On these rigs is it normal for the Dial to be Off
from one end to the other. What I mean is, If I adjust the dial to
read 14.000 when The digital display says 14.000 then I go to say
14.300 on the digital display, is it normal for the Analog dial to be
1 or 2 kc's off ?

You're welcome Bob. :)

Yeah, I guess I was thinking of a Swan Cygnet I briefly used in 1993. With it's sweep tube final, you had to be pretty quick with tuning it up, otherwise the final had a short life.

Hi Gordon,

In my experience with my TS-820 (and other analog dial rigs I've owned), yep, that's pretty normal. If you insist upon the best accuracy with just an analog dial, you use the crystal calibrator, to calibrate the dial in the vicinity of the frequency you plan on operating on. Also, calibrating at say 7.150, instead of say 7.000, or 7.300, helps to keep lower the amount the dial is off at the band edges. Basically, I just do like the old timers did, I try not to hug the band edge. Otherwise, use a digital frequency counter/readout.

73,
Ellen - AF9J

7835. Ken's Electronics microphones for Kenwood hybrids - the verdict

From: Ellen R
Topic: 7835 Message: 7835

Hi Everybody,

Some time ago, I promised you that I'd let you know how well the hand mic I got from Ken's Electronics worked with my TS-820. Here's my verdict. Ergonomically it's OK (although I wish the PTT switch spring was less stiff,and that maybe the housing was a little smaller). Audiowise - I've gotten good reports on my audio. I've also used the monitor to to self-check my audio, and it sound better than some of the newer rigs I've had in the last decade or so. I run the processor all of the time (I've always been a maniac about seriously watching my ALC when I use a processor, since too much ALC and compression not only causes a lot of spurs, it sounds awful), so if a mic works decently with a processor, then it's fine by me. The price was right for the mic. The delivery time was good. I have no complaints, it was a good buy for me.

73,
Ellen - AF9J

7836. How to calibrate really and exactly?

Yahoo group: TS-520_820_530_830 (2006)

Hi folks

".. If you insist upon the best accuracy with just an analog dial, you use the crystal calibrator,
to calibrate the dial in the vicinity of the frequency you plan on operating on..."

I have a TS-520S and would like to know, how I have to use the "25 KHz-CAL" Switch correctly (the hole procedure!). I'm not shure about (USB/LSB or CW, tone etc".

Daniel, HB9DDS

From: digs4ruff
Topic: 7839 Message: 7839

Still trying to figure out how to adjust this rig properly and have a couple of questions where the manual is a little short on explanation.

"MIC GAIN KNOB
This knob is used for adjustment of the gain of MIC amplifier during SSB operation. Adjust so that the meter pointer does not deflect beyond the ALC zone."

I assume this means tune the rig first and have the mode switch in USB or LSB and speak normally into the mic. The needle should stay within the ALC zone but what position is the meter switch in? With MIC GAIN fully clockwise and meter in RF position I barely see half deflection on ALC scale. With meter in ALC position I see full scale deflection.

"COMP LEVEL
Adjust the state of compression by turning the knob while observing the COMP meter."

Can this be translated to layman terms so that I might understand what needle reading I am aiming for on which scale? In USB & Meter set to COMP and COMP LEVEL max CW when I speak I see deflection about 2/3 of ALC scale. What should I be setting this to as my goal.

Tnx & 73s
Barry

Barry, When you adjust the Mic control, be is SSB position (either USB or LSB) and put the Meter switch in ALC position. Then adjust the Mic control while speaking Normally into the Mic to stay within the ALC range. This is all done AFTER you have done the Tune and The CW position Loading.

Hi James,

I used clear silicone seal to hold the new capacitors in place. It worked really well. Because of the number of connections to the old capacitors and the small size of the lugs on the new capcitor, I had to put a terminal strip in place and wired most of the connections to the capacitors to that . I can send you a picture of the final layout if you wish.

73's

Steve

Hello to all,

after a while of silence from my side,
I had the chance to get a good looking TS820
and other accessories for a line.
I do also now have a second R-820 in
good condition with a lot of optional filters.
In works all good ,only a switch in the TS820
needs some deoxit.If you want to have a look
at them , here is the address: www.pbase.com/dl5oaq

Topic: 7844 Message: 7844

Hey guys from Australia

I have a nice old TS520 that I am restoring.

I had an idea that the 6146's were a bit tired, power falling off etc.

Anyway, had a play tonight and the radio started making an electrical arcing noise, the lights all dimmed and the thing smoked from the fan on the rear.

I pulled the top off and it seems that one of the 6146's is arcing quite badly (and I guess pulling huge amps/volts out of the plate).

My question is this:

Is this a common way that these tubes die?

I think this radio has had a real hard life before I got it (from e bay of course)

Has anyone ever had this happen or is there another cause?

I know this is an old post, but comment anyway. I had a TR3 for many years and the dip on the 6JB6 finals was extrememly pronounced, narrow, and more obvious than on my 820s. Do not know if that was a characteristic of Drake or just the sweep finals that it used. Bought it new, but is in mothballs with blown caps from living in improper storage ina damp environment. The copper chassis did not help much either. Going to be selling it a a parts rig soon. My 718 Icom has put the 820s into backup rig status as it is so easy for an old guy to operate, HI!

My 820 has a very pronounced dip when Tuning. It also is putting out
right at 120 watts on 20 meters.

Ellen:

I am not sure if this reply will mean anything as my memory of the conversation is so vague. Several years ago I purchased a 949E tuner, which is a MFJ product, and prior to the warranty expiration, I called with several questions, most of which I do not remember. I know we talked about the hand inductance problem they have and a few other things. I also remember that I had a very honest guy on the other end. I think the main thrust of the conversation was about a G5RV and 17 meters, and how I should do an oatmeal box coax coil on the shack side to get better results.

Somehow the coversation shifted to the dummy load on the tuner and the tech, if I remember correctly, told me that it works OK, and gets the job done for off the air function but not to put 100% faith in it for power readouts. For more accurate reads, I should use the oil can variety or other dedicated dummy load. He mentioned something about how the "real antenna" comes into play with the dummy load feature, which could cause readings to be somewhat distorted.

Although this is a very vague commentary, I did appreciate the honesty of the guy on the other end of the phone. Budget gear, budget results. I'm sure that someone could chime in with a more intelligent deduction. Maybe this is related to the readings that you had. Maybe not, just 2 cents from this end.

Anyway, five years later, still using the same 949e tuner and the same G5RV. I am putting up a dedicated 17m dipole for the Icom 718. (Had ham radio here three years before the house was finished. The house was a weekend project. What is more important, anyway?)

Walt or some of the other great minds here can give you a better answer, but the speech processor only likes certain mics without a mod to the processor itself, which is available on a search. Can't give you a link, as I just rebuilt the PC, with overclocking, rocket launchers for the video card and everything else that trashes the warranties.

(But it works great....3.2 Pentium running at 4.1 GHZ and 300 MHZ video card now running at over 500 MHZ for over a month with no probs...Keeping it cool ....that is a book in itself...Still working on getting the sound level of the 747 down to a DC-9 level.)

Gordon
My 820s won't go over 100w on 20M as measured on an external meter
with 1:1 SWR.
With switches set at CW, SEND, meter on HV, HV is 760V.
WIth switches set at CW, SEND, meter on RF top scale reading is 275.
With switches set at TUNE, SEND, ALC there is no fading of the ALC
over 10 seconds.
Does this sound normal or is some attention required somewhere.
thanks for all the help.

Hi Kay,

That is a nice looking TS-820S. It looks as good as my TS-820 (the first in this series of transceivers - the one without the digital display [it was only available as an option], and was made in 1976-1977). They are good rigs.

7858. Re: TS-820s Set Up

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-03 01:00:23 UTC
From: Ellen R
Topic: 7839 Message: 7858

Hi Barry,

I have a TS-820 (the first year production version of this rig, which came stock, without the digital display). Gordon is right about using the ALC meter function to set up mic gain. Just make sure that mic gain is set up so that, on voice peaks, the meter reading stays in the ALC marked range. Going beyond this will only generate spurs, splatter, and distortion, with vey little, if any increase in ouput power. I always set the carrier level for CW to be in the AlC range too, for the same reasons I just mentioned. Max ALC pretty much translates to max output power.

As for the processor, yes you can use the Comp meter function. It will show you how much compression you are using, and that's about it. Personally, what I do is this:

1. After getting the basic Mic gain settings down, switch your Comp Level (processor) on, at about the halfway point (it's a good starting point with the 820; too much processor on this rig makes the audio nasty).

2. Put the meter in the ALC function, and adjust the mic gain, to bring the voice peaks back down into the ALC range. Now check your audio either with a friend on the air, and/or use the 820's built-in monitor, and a set of headphones (to listen to your audio).

3. How does your audio sound?
A. Is it kind of muddy or muffled? Then your Compression (Comp Level control) is set too high. Turn it down, and turn up your mic gain to bring the ALC meter reading back to the upper end of the ALC range.

B. Does it sound a little wimpy? The turn up your compression, and once again, turn down your mic gain, to bring the voice peaks back into the ALC range.

4. Repeat Step 3 until you are satified with the results.

Speach Processing/compression is a double edged sword. Any time you use compression you raise the average power output (by minimizing the swings in power level that speech causes to a signal). But, the downside is that when you lessen these power swings (which reflect the volume changes that occur while you speak), you lose definition (and in extreme cases intelligibility) to your speech on the air.

I've had good results with speech processing, but it's due in part to the fact that I watch my ALC level like a hawk, and I speak with a

pretty even voice, which keeps the voice peaks from being too
radical. I also don't go verbaord with the compression level. Many
hams avoid compression & processing like the plague. It is not
necessary to use speech processing to get good results on the air,
with your SSB signal. Oftentimes, just using a mic, or EQ with good
audio characteristics can make all of the difference in the world.
Good luck.

73,
Ellen - AF9J

That's probably true. I began to feel about 2 weeks ago, that my dear old air cooled MFJ dummy load wasn't exactly 1 to 1, and might be a little reactive.

By the way Kay, I see you have an FT-221. I have one too, that I won on e-bay as a non-runner. It's working now. Since I want to get the receiver at least up to the level of my dearly beloved FT-736R I had to sell a few years ago, I e-mailed Mutek, to ask them if they still sell the receiver front end upgrade boards. Chas e-mailed me today, to inform me that they are considering offering the receiver upgrade boards again, and hopefully will have them available soon. The first board they will make available, will be for the FT-221.

73,
Ellen - AF9J

7862. TS-820 for sale

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-03 04:23:36 UTC
From: Greg White
Topic: 7862 Message: 7862

I bought a TS-820 on ebay for my first ham rig. It has 160m so I think that makes it an 820S, anyway, it recieves, but I can't get it to transmit. I thought when I bought it if it didn't work I would try to fix it then use it, but with so many other new things to learn, I figured I would rather not have to try to mess around with an old radio so I bought an icom 817. I am going to list the Kenwood on ebay unless anyone here wants it. It cost me about $200, I would like to get my money back. If anyone is interested, email me, I am in WA state.

Hi Greg. Isn't eBay a wonderful place. Almost everything I have bought on eBay has had some type of problem(s).

How clean (or dirty, scratched & rusty) is it? Do you have a photo, or can you give me the eBay item number so I can go look at what you saw when you bought it?

Thanks & 73, Bill, K5GCW

Gordon
My 820s won't go over 100w on 20M as measured on an external meter
with 1:1 SWR.
With switches set at CW, SEND, meter on HV, HV is 760V.
WIth switches set at CW, SEND, meter on RF top scale reading is 275.
With switches set at TUNE, SEND, ALC there is no fading of the ALC
over 10 seconds.
Does this sound normal or is some attention required somewhere.
thanks for all the help.

Walt
TVM
Will check line voltage later today and report back.
Without an external meter (which I can't check accuracy of) one
would have to rely on the 820s meter.
"With switches set at CW, SEND, meter on RF top scale reading is
275."
Which scale should I be reading and what should I expect to see.

7870. Multiple RL1 relays in the 830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-03 14:48:58 UTC
From: belbert2002
Topic: 7870 Message: 7870

To follow up on my previous postings on the problem keying a linear, I finally figured out that there are two RL1s. The one that keys the linear through the Remote DIN on the back is plugged into the chasis and points downward. There is a metal shield over it which must be unscrewed, then the relay is easy to pull out. The plastic cover can be unpotted with a razor blade (don't cut yourself!). I cleaned the contacts with the recommended business card soaked in DeOxit, and discovered that they were oxidized and the source of the high resistance.

The other RL1 is on the AF board and is the one I damaged when removing the plastic cover. It's working fine. I ordered a replacement from www.kenwoodparts.com, and it arrived (from Japan) in about one week, which is great service. I now have an extra relay if anyone needs one.

Hi Greg,

Info to add to your e-bay add - the S in TS-820S, does not mean that it has 160m. I have a TS-820. It also has 160m on it. Unlike the 520 series, all the S means in the 820 series, is that it was made in 1977 or later (the plain TS-820 was only made in 1976-77), and has a digital display as standard (the digital display was only available as an add-on option for the TS-820). All TS-820s made in 1977 or later, are TS-820S models.

Hi again Barry,

Does the circuit board have any crystals on it? The only thing I can think it is (and this is probably a long shot), is possibly a transverter, since it has RFin, and RFout connectors.

Ellen
Unfortunately the box has not arrived yet, just the photos.
A transverter does sound feasible but there does not appear to be
any components capable of handling any amount of power so I was
thinking maybe a preamp for SWL or maybe QRP application.
thanks

7877. Still looking for a YG-455-C 500 Hz CW filter

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-03 17:39:39 UTC
From: belbert2002
Topic: 7877 Message: 7877

If anyone is interested in selling a YG-500-C 500 Hz CW filter for the 830S, I'm very interested in buying. I'm offering $80 plus shipping. I tried out a C-1, which can be soldered in but as has been pointed out has a different center frequency. This can function on its own but does not work correctly in conjunction with the YK-88-C.

Thanks and 73, Bruce, K6ZB

Ellen
I thought the same but I have been wrong so often, and my mother taught me it is better to keep my mouth shut and be thought a fool than to open it and be known as one.
I have had the rig operational now for about 4 months and as yet have never heard a station from east of utah. Our main conduit on 20M seems to be Alaska to Cal/Texas. Ocassionaly I will talk to Eur/Japan/Hawaii/Cook Isl/New Zealand. I keep listening for something from the mid-west or the east part of Canada or USA. I have only had one contact on 15M so far and that was just into Wash. Who knows what may happen in the future.

7882. Original TS-820 Brochure

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-03 19:53:59 UTC
From: Gordon
Topic: 7882 Message: 7882

I was going through some papers here today and I came across one of
Kenwoods ORIGINAL brochures for the TS-820 (Not the S)
It's in Pretty darn good shape too.
They refer to the 820 as "the Kenwood TS820 Pacesetter"

It starts off with " The pasesetter Transceiver is Here.......
the fruit of an all out effort by Kenwood's engineering
department....... then it goes on to say The finished product is
here, The Kenwood TS-820 Pacesetter. "
Kind of neat to read through.
I wonder if thing has any value out there?

Gordon

Hi Barry,

Sorry about the goof. OK, if condx get better for a path to the
midwest, let me know, if you still need a test for the processor.

73,
Ellen - AF9J

Ooops! Sorry. OK, lets try again.

Barry, I live in Wisconsin. If you're willing to chance it, we might be able to make it on 15 or 20m, if you want to do on-the-air setup of your TS-820S processor. I'll leave it up to you. Lioke I said, you don't have to necessarily use the processor with the radio.

Gordon
The brochure for the 820 should be worth $
If it was for 820s it would be worth $s

Ellen
Tnx. Will listen for any calls from your area but nothing so far.
Everyone says the bands will improve and if the newbies are having
fun now it just gets better.

7893. 820 multimeters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-04 10:58:40 UTC
From: Walt Breining
Topic: 7893 Message: 7893

Regarding the multimeter in the TS-820S.

In RF, it is reading relative RF volts. It is for tuning if you do not have an external wattmeter. It cannot be used to measure your output in watts. Because it is relative, this function does not have a meter scale dedicated to it. the RF control on the back of the radio should be adjusted so it reads 2/3 scale under full power CW on 40 meters.

IP. At the top of the multimeter, there is a scale labeled mA. It goes from 0 to 350. This is the scale to use when the meter switch is in IP.
In IP you are measuring the current flowing through the cathodes of the final tubes. For most practical purposes, this is the same as the plate current.

The second scale from the top is the S meter scale. It indicates the strength of the incoming signal on receive. This is used only on receive and is not dependant on the setting of the Meter (multimeter) switch. The Meter switch only operates on transmit.

HV. The third scale from the top is labeled HV. This is the scale to use when the meter switch is in HV. This scale goes from 0 to 10. This is a X 100 scale. 8 = 800 V 10 = 1000v. This measures the DC high voltage to the final tubes. A typical reading is around 800 Volts or 8 on the scale.

COMP. The fourth scale down is labeled COMP. This the scale to use when the meter switch is in COMP. This will only read on SSB and only when the speech processor is on. The Comp level control for the processor should never be set so it exceeds 20 dB. Typically it sounds best if set to 5 or 10 dB.

ALC.

The last (fifth) scale down is the ALC scale. It is a short scale. The top of this scale is just a little over half way across the meter.

In ALC it is measuring your relative driver output. This is derived from the Automatic Load Control voltage. When tuning up in CW or Tune, the meter should be in the ALC position when peaking the Drive control. The carrier control fully up when peaking the Drive.

When sending CW, the CAR (carrier control) should be adjusted to about 1/3 of this scale or less.

When operating SSB, the mike gain should be adjusted so voice peaks seldom exceed the top of this scale and if the speech processor is used, the mike gain should be set so the voice peaks average half way on this scale never exceeding the top.

Setting the PA idle current.

Set the multimeter in IP. Turn the mike gain fully down. Place the mode switch in USB or LSB.

Turn the MOX switch to transmit and note the reading on the mA (top) scale on the multimeter. It should read 60 mA. If it does not, adjust the bias adjustment on the rear of the radio for 60 mA.

Note: 100 on this scale is 100 mA. So 60 mA will be slightly more than half way between 0 and 100. The mark exactly half way between 0 and 100 represents 50 mA.

I find that it is easier to tune up these radios if an external watt meter is used. The multimeter can then be left on ALC and the wattmeter can be used instead of the RF meter function. This saves a lot of switching.

Not all watt meters are accurate. Many people worry that their rig is not transmitting properly when in actuality the watt meter that they are using is reading low. The load complex impedance affects the readings greatly. The most accurate readings are made when using a 50 - 52 ohm dummy load. An antenna with a very flat SWR can often be used, but in some cases a antenna with a flat SWR may still have some slight + or - reactance that will affect the watt meter reading.

Another common cause of slightly low output is low line voltage. They are designed for 117 to 120 volts. Reduced line voltage will result in low High Voltage to the final plates and reduced output. Other than reduced output, slightly lower than normal voltage will not cause any other serious problems unless it is changing when the rig is being modulated.

Sometimes the signal from a transmitter will affect the reading of the meter being used to measure line voltage. This usually does not happen if a dummy load is being used. If this happens and a dummy load is not available, check the voltage without transmitting and then plug an incandescent lamp into the same outlet or power strip the transmitter operates from. If the lamp dims noticeably when transmitting, this indicates that the voltage is swamping when transmitting.

Perhaps this will be helpful.

7894. Need co-moderator

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-04 13:41:38 UTC
From: Bill
Topic: 7894 Message: 7894

Hi all,

We are in need of a co-moderator for this group to cover things while I am gone or unable to check things.

Activities include approving new members, maintaining the FILES, DATABASE and LINKS sections; moderating the group as necessary (about twice a year, perhaps!) and promoting the group as desired.

I spend probably 5 minutes a day, checking and approving new members, and attending to the above items. I would like to spend more time, particularly with the repairs database but job, business and family preclude that.

I would give preference to someone that has moderated or owned Yahoo groups before, is an active poster to the group and is a licensed ham radio operator. Prospective moderators do not have to reside in the U.S.

Please email me DIRECT if interested, thanks.

73,

Bill K0ZL

Topic: 7733 Message: 7895

Walt,

Sorry it took so long to respond to you on this, but thanks for the info. I have owned my 820S for about 4/5 years and have had a lot of good luck and audio reports with it.
So far the only thing I had to do was change out the 12BY7 tube and have the tuning slug reset for 20 M. Somehow it fell out of it's slot. I had them all re tuned and a small drop of silicone put on them so they do not move again. The radio seems to put out a little shy of 100 watts.

My mic set-up I am using all this time is an amplified D-104 with the 10DA Sideband head on it turned up only about half way. I have the radio fed into an MFJ 969 tuner (usually on the bypass mode). 50 feet of RG-8X goes into a 4 to 1 balun and into 4 separate dipoles on the roof.

I also run a TS-850S and an ICOM 735 all on an antenna switch with a couple of other verticals to cover 10-40 meters inclusive

Frank

hi,

in Photos section of this group,
misc. page #2 are two photos.

the Spectroincs DD1-K uses LEDS
the Henry DFD-K uses Nixie tubes very retro !

Nice feature is these will work with all
kenwood 820/520 series, have internal ps,
just use pins 1+2 for the vfo signal to the
rca jack on the rear of the display.

Note these are not lab grade counters but very close for our use.

Hi Bob

DD1K?? How does this look like?? I don't find anything in the internet!

7898. Lost drive on one band...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-05 17:08:12 UTC
From: Hauser, Ron M.
Topic: 7898 Message: 7898

Ok, so I have looked back over the archives, because I think this has
been discussed before. But I can't find it. I have a TS830S.
Yesterday I had it on 10m and all was well. Later in the evening I
moved to 20m, and had various QSOs. Today I fired it up but I can get
no drive on 10m. I checked on other bands, and I still have drive on
other bands, same as before. I thought for sure there was a discussion
about this on this list, but I can't find it. I had to lose something
specific to the band to make that drop...

Any thoughts to point me in the right direction?

Thanks!

Ron,
Sounds like your bandswitch may need a little cleaning.
A little De-oxit carefully applied should solve the problem.

73,
Jon

Ron,
It sounds Exactly like a Dirty Band switch. Do you have some De
Oxite handy to spray it. Be sure the radio is OFF and Unplugged when
you spray it, work the band switch back and forth a bit, then let it
dry for a few minutes before plugging it back in
Part of the Band switch is INSIDE the Finals cage, so be sure to let
the High Voltage bleed down before getting inside there.

Ron,

When it happened to my TS-830S about two years ago, just the 28.000 to 28.500. I had to have the band switch replaced. I hope this helps!

The computer paint machines do a pretty good job on anything but beige type colors in particular when there is a pinkish tone or something involved. Do not know why. Darker or just greyish offwhite, they do well. When I had a slight pinkish tint to a beige to match on some old paint couple years ago, gave up on the Lowes and Depot and had to go to an old fashioned paint store to get the match.

Ron,

Were you inside the final cage, remember to check the plastic coupling. It
may be cracked that causes similar problem due to de-synchronizing wafer
switch (rotary switch) of the RF stage.

Well said.

In addition, in as much as I love the Drake stuff, the copper chasis was not a good choice for long life in bad storage environments. That is first hand information. The revival rate for many pieces of old gear relies very heavy on the foundation of the rig itself. Copper is great decor on a home because it corodes. WTH?

Agree again...Summer project....Get the G5 up another 15-20 feet, as the tree is right there. That will get me above the highest neighbor within a good mile or so. Chances are, no harm will be done, and if so, still have a multi strand string going to the same branch. Chances are, the multi strand string will come down soon.

Dead on, Ellen.

I will just step more softly and spray a lot of weed killer this year. If I walk up on another Timbersnake this year, I would like to see it sooner...aka rattlesnake that climbs trees

7906. Strange problem on TS520 (help)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-05 22:05:28 UTC
From: m_m_maxau
Topic: 7906 Message: 7906

G'day Guys

I have a TS520 that has a strange problem,

It starting arching across one of the final tubes, but at the same time the panel lights dimmed quite low and you could hear the "zzz" noise of the arching.

It also started smoking from the vicinty of the finals.

I think that I may have cooked something as I accidently loaded up the tuning in CW not tune.

Sounds to me like the plate voltage has gone troppo, but I don't know alot about these.

I have also noticed that when I switched to tune the meter deflected all the way to the right and stayed there until I turned the radio on and off again then it slowly went back to the left.

Any ideas for this dumb VK from Downunder?

Thanks
Anthony

Anthony, You sure one of your Finals just didn't give Up on you ?
Kinda sounds like it. If it Arc's in side, it will draw a LOT of
current. In favt, usually, it will BLOW the fuse when that happens.

Gordon

7908. TS 830S RX PLL "Out of Lock"

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-06 04:14:22 UTC
From: Bill Marvin
Topic: 7908 Message: 7908

Hi Group,

My TS830 is OOL on RX only no display. TX is fine. I found on
the AF Board the 9V and 3.6V RX was < 1.0VDC but the 12 VDC to be OK.

Q30 and Q34 are the pass transistor's for VR1 9vdc and VR3 3.6vdc
respectfully on the AF Brd.

Any Ideas??

Bill

Bill,
I do NOT have an 830 Schematic in front of me, but if the 9 V source
is < 1.0 volts, I would start by tracing that circuit backwards.
Sounds like you have an Open Resistor some where in that circuit. I
will see if I can dig up a good schematic of an 830 to see if i can
help you out. Still, I will bet you have an open Resistor...
Do you hapen to have a good schematic that I can look at for your 830 ?

Now for the nitty... Any moderator or co-owner can be easily reached by logging into the group and clicking on Members, there on the left side. Then at the top of the membership list, just click on Moderators and the list will pop up. Any one of our fine new management group will be able to help you out with just about anything.

I don't forsee the group changing direction or policy anytime soon. But any changes if needed will be up to the moderator/owner team. And of course if anyone has any ideas that will improve the group, just run them by the mods, or post directly and everyone can comment on your idea if you want. Some would say, "if it ain't broke", etc, but how do you know? hi.

Anyway it has been my great pleasure to have been involved with the group since the very beginning. We have seen scads of these great old rigs fixed as a direct result of the interaction on this group, and of course our personal technical skills have all improved somewhat, just from being involved. And isn't that what ham radio is all about?

I intend to stay involved as much as I can. I will be coming in with a new email and ID (I really like Gmail!). I will leave it up to our new moderator/owner team to decide who does what and when with the group so there is the least chance of conflict.

73 and may God bless you all,

Bill K0ZL

Hi Ron.

You are getting good comments on the bandswitch. In addition, you should check L36 and C74 on the RF Board. A few months ago two of us experienced L36 becoming shorted which affected the drive level on one or two bands. In my case, it was 15M - all the other bands appeared to be working fine. I think what happens, as these components change value, is that a series resonance takes place which will short out the resonant frequency and reduce or eliminate the drive signal on that band, or a range of frequencies that may affect more than one band. In any case, replacing L36 restored 15M operation on my TS-830S. I think VK5KYO did a nice writeup on this situation which was placed in this group's files for reference - you may want to check on that.

If it is the bandswitch, it can be repaired with some time and patience. Go to K4EAA's website where he has a fairly detailed written procedure to do that - complete with photographs. It took me about 3 days work to completely remove all the bandswitch wafers, fix the contact problems, and reinstall everything. If you do this, just go slow and keep good records of where everything goes.

Good Luck with your 830, and have fun.

Subject: [TS-520_820_530_830] Lost drive on one band...

Ok, so I have looked back over the archives, because I think this has
been discussed before. But I can't find it. I have a TS830S.
Yesterday I had it on 10m and all was well. Later in the evening I
moved to 20m, and had various QSOs. Today I fired it up but I can get
no drive on 10m. I checked on other bands, and I still have drive on
other bands, same as before. I thought for sure there was a discussion
about this on this list, but I can't find it. I had to lose something
specific to the band to make that drop...

Any thoughts to point me in the right direction?

Thanks!

7914. IP Max on TS820 in CW mode

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-07 05:09:50 UTC
From: Ron Hauser
Topic: 7914 Message: 7914

Ok, so I have two of these old kenwoods, a TS820S and a TS830S. After my success yesterday of opening up my 830 and fixing some stuff... I decided to get on with the repairs of my 820. My 820 fried its cathode resistors, and a friend tested the tubes and they tested pretty bad. So the plan was to replace the cathode resistors, replace the tubes, neutralize them, and keep my fingers crossed. I built the lightbulb tester recommended by Walt, and when I powered up the rig, I got a very brief bright light as the capacitors charged, then a nice safe dim light. Whew! So the tubes seem ok. I set up a wattmeter and dummy load, and used the Walt method to get the peak of the power to match up identically with the dip of the plate. This seemed to work just fine, I spent a lot of time sweating it to try to get it "perfect"... I'm not sure it is perfect but it is very very close, so I think that is ok. Many thanks to all the wise contributors on this list, I would never have taken on this level of repair without the knowledge that is passed so freely on this list.

So I have a simple question. The 830 manual says to load up the IP to no more than 265 ma, and in CW with the CAR control turned down to get no ALC, I have about 250-255ma, and 100w out. With the same wattmeter, when I load up my 820, I can get 100w out, with around the same 250ma. But for some reason the manual for the 820 says don't run more than 200ma in cw. I turn the CAR control down to 200ma, and I have about 50w out. This isn't really a problem the doubling of power isn't increasing the received signal that much, but I just wonder if this makes sense. The same tubes, same driver tube, same HV levels... Why not run the 820 at 250ma and 100w? Is this just conservative recommendation from when the manual was written?

Bill, thanks for the encouraging words. After my 10m band mysteriously disappeared, I finally made time to take the radio to the basement and open it up; and indeed, the deoxit fixed 10m. However, it didn't fix the no drive on 30m, which I have "always" had. While I had it open I was able to check that the WARC bands were enabled (they are, all). At that time I couldn't find the long and descriptive email from VK5KYO, so I closed it back up and tested it out. Success, and also success on another little fix, I recentered the RIT and turned down the gain on the sidetone. As you recommend, I have now found the emails referring to L36 and C74 on the RF board, so next time I have it open I will test those. Worst case I will have to do the bandswitch.

Much thanks to this group for the positive advice and support, to help an electronic klutz like me to fix my own radio! It gives great satisfaction!

From: Walt Breining
Topic: 7914 Message: 7916

Ron:

Good going on your 820 repair!

If with the carrier control at maximum, The drive is peaked for maximum ALC and the Load and then the Plate are peaked for maximum watt meter reading, I would not worry about running 250 ma. If you are going to run SSB, you can leave the carrier control at max as it does not affect SSB. However, if you are going to run CW, note the following.

After adjusting the 820 for maximum output on CW, if you are going to operate CW reduce the carrier control to the point that the watt meter just starts to drop. You may show little or no ALC reading at this point. Your CW wave form will be cleaner than if you are running a lot of ALC control.

Be sure that your idle current is 60 ma. This is done by placing the rig on LSB or USB, turning the mike gain fully down and checking the IP. It should read 60 ma. If not very close to this, set it with the bias control on the back of the TS-820.

Be sure that you have the correct fuse installed. 6a for 120v operation. That way if a tube should short again, it will blow the fuse and save the transformer.

It is also possible that the cathode resistors are a bit high in value making the IP meter read high. These are the meter shunt and will affect the meter accuracy in IP.

But I really wouldn't worry about it a lot.

With the same wattmeter, when I load up my 820, I can get 100w out, with around the same 250ma. But for some reason the manual for the 820 says don't run more than 200ma in cw. I turn the CAR control down to 200ma, and I have about 50w out. This isn't really a problem the doubling of power isn't increasing the received signal that much, but I just wonder if this makes sense. The same tubes, same driver tube, same HV levels... Why not run the 820 at 250ma and 100w? Is this just conservative recommendation from when the manual was written?

Hi Walt, thanks for your reply. Ok on all. I decided to get into these hybrid rigs to be able to learn about tubes, so it is very satisfying to start feeling like I somewhat know what is going on. I appreciate all your help.

Subject: Re: [TS-520_820_530_830] IP Max on TS820 in CW mode

Ron:

Good going on your 820 repair!

If with the carrier control at maximum, The drive is peaked for maximum ALC and the Load and then the Plate are peaked for maximum watt meter reading, I would not worry about running 250 ma. If you are going to run SSB, you can leave the carrier control at max as it does not affect SSB. However, if you are going to run CW, note the following.

After adjusting the 820 for maximum output on CW, if you are going to operate CW reduce the carrier control to the point that the watt meter just starts to drop. You may show little or no ALC reading at this point. Your CW wave form will be cleaner than if you are running a lot of ALC control.

Be sure that your idle current is 60 ma. This is done by placing the rig on LSB or USB, turning the mike gain fully down and checking the IP. It should read 60 ma. If not very close to this, set it with the bias control on the back of the TS-820.

Be sure that you have the correct fuse installed. 6a for 120v operation. That way if a tube should short again, it will blow the fuse and save the transformer.

It is also possible that the cathode resistors are a bit high in value making the IP meter read high. These are the meter shunt and will affect the meter accuracy in IP.

But I really wouldn't worry about it a lot.

Vy 73, Walt N9WB

Subject: [TS-520_820_530_830] IP Max on TS820 in CW mode

Ok, so I have two of these old kenwoods, a TS820S and a TS830S. After my success yesterday of opening up my 830 and fixing some stuff... I decided to
get on with the repairs of my 820. My 820 fried its cathode resistors, and a friend tested the tubes and they tested pretty bad. So the plan was to replace the cathode resistors, replace the tubes, neutralize them, and keep
my fingers crossed. I built the lightbulb tester recommended by Walt, and when I powered up the rig, I got a very brief bright light as the capacitors
charged, then a nice safe dim light. Whew! So the tubes seem ok. I set up a wattmeter and dummy load, and used the Walt method to get the peak of the
power to match up identically with the dip of the plate. This seemed to work just fine, I spent a lot of time sweating it to try to get it "perfect"... I'm not sure it is perfect but it is very very close, so I think that is ok. Many thanks to all the wise contributors on this list, I would never have taken on this level of repair without the knowledge that is
passed so freely on this list.

So I have a simple question. The 830 manual says to load up the IP to no more than 265 ma, and in CW with the CAR control turned down to get no ALC,
I have about 250-255ma, and 100w out. With the same wattmeter, when I load up my 820, I can get 100w out, with around the same 250ma. But for some reason the manual for the 820 says don't run more than 200ma in cw. I turn the CAR control down to 200ma, and I have about 50w out. This isn't really a problem the doubling of power isn't increasing the received signal that much, but I just wonder if this makes sense. The same tubes, same driver tube, same HV levels... Why not run the 820 at 250ma and 100w? Is this just

Ron,

I agree with Walt. I do the usual tuning method described in the manual (which frankly isn't that much different than the method desribed for the TS-830S), for my TS-820 (the 1st year "before 820S" version fo your 820S). I then turn the carrier down to Max ALC (or as Walt said, just when the RF output starts the drop). After max ALC, you really won't get much more output power out of the rig, and all you'll end up doing is working the driver tube (and possibly the finals) hard, and possibly dirtying up your CW waveform. It's actually a good practice to turn the carrier/drive back down into the ALC range, for any tube or hybrid rig, to help keep the CW waveform cleaner, and prolong tube life.

73,
Ellen - AF9J

7919. Group changes Pt I

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-07 17:10:29 UTC
From: Bill
Topic: 7919 Message: 7919

Well I spent a lot of time typing up an intro to the group for our new moderators and co-owner, only to have Yahoo eat it. I hope Yahoo got indigestion, big time!

Anyway please let me introduce our new moderators.

Jon KD5SFA has been with me from the beginning of the group, and also is helping on at least two other groups, Amateur-repairs and HAMFTP.

Ellen, AF9J is relatively new to the group but not to Yahoo groups; she moderates two other groups, one ham-related and one not.

Gordon, N6WK comes to us from the SKCC (Straight Key Century Club).

I would like to thank Jon, Ellen and Gordon for stepping up to help. I had several other group members offer to help out, please forgive me if I did not acknowledge each on individually as would be proper. THANK YOU.

Last but not least, please welcome Walt, N9WB as our new co-owner. Walt has been around since I first started forming some of the Yahoo ham radio groups and I think he belongs to all the ones I have started (and one or two I have since left!). Walt is a good moderator and a steady contributor.

Everyone that sent me an email offering help mentioned how great this group is and I would have to second those opinions. We have seen very many rigs repaired and a lot of personal growth and development among our members; this is very gratifying and one of the main reasons we do this.

I don't forsee a lot of changes for the group in regards to policies and so forth. We are currently deciding whether to open up the membership list so that members can "see" other members and contact moderators more easily; we will do it in such a way that your emails will be hidden from bots and spiders.

Again, thanks so much to Jon, Ellen, Gordon and Walt for stepping up to help out; to all those who wrote in but were not selected, and most of all to all of our group members, who make this thing work!

Vy 73 and God bless,

Bill K0ZL

Topic: 6444 Message: 7920

Joan and Bill: The question first. When you test C74 and L36 on the RF board, how do you get probes onto them? Do you have to remove the bandswitch pull the RF board to get to the contacts on the bottom side? (ack).

I have been doing some testing on the bandswitch contacts and they show very low resistance so I tend to think that is not my problem. It's not proof I know, but I'd really rather find a specific measurable problem before I really start tearing the radio apart. I have no drive at all on 30m, and only 30m, and I really suspect this same problem on the RF board at C74 and L36.

Thanks!

Subject: Re: [TS-520_820_530_830] TS830S low power

Hi everybody

For those interested in my original posting of the message, read below.

I am assuming that no other person has seen this problem before, except Bill-K5GCW who got in contact with me and explained he has the same problem with his 830, even after spending some considerable time cleaning the wafer switches.
Well if you read this Bill, I have found the problem(s). If your lucky, it may be the same problem.

A recent posting by another Bill-WB5DX, who cleaned the switches with de-oxid?? and has gone backwards in the process, may also be interested in reading this, because I think Bill may have disturbed the rivet connections of the wafers, or maybe some cleaning material is lodged in the switch as it is difficult to get in there, or he may have even bend some of the contacts. Its not hard to do.

Anyway
I did as what most of you would do and that is to remove the RF board, number each wafer, desolder each one and clean the switches and while it's out, you also solder each wafer contact to the track of the switch. This requires a lot of patience and a bit of skill to reassemble and realign all the switches before soldering them back on the board.

I found a number of contacts which were loose. The rivets were not doing their job anymore. The material must have shrunk a little. This is why you have to solder them, if you want the 830 to be reliable.

Now in Australia I heard of a saying, that whenever something gets serviced (be it electronics or otherwise), they say that "it has gone in for a grease and oil change".
It's a funny expression but when I pulled apart this wafer switch, I could relate to that. 2 of the switches had a liberal coating of a thick, greasy substance, and the RF board had a coating of what appears to be oil. It was a big cleaning job.
But all the cleaning and soldering made absolutely no scrap of difference. Still very little output on 18MHz, and no ALC at all.
I lost track of the number of times I pulled that RF board out.
For those that havent worked on these, you can make only limited measurements because the way it's mounted, and access to the track side of the board while it is switched on is near impossible.
I knew where the problem area was, except everything appears to be checking out. eg component values, connections, switches etc etc.
Then I found a bypass capacitor C74 which measured 500 Ohms I replaced and with excitement put it together. I improved the output on 21 MHz considerably, but still not much happening on 18.
If you study the circuit, you will wonder how this capacitor could have an affect on the output. (It all makes sense later on)
Then tonight, I finally had a breakthrough. I have been so close for days but missed it.
The neighbouring component to C74 is a RF choke L36. This choke has gone nearly short. It measured 30uH with a large D factor. The original value is 470uH.
Needless to say, I was very excited to have found it long last. I put it all back together and aligned the RF board again and output on 18 MHz was finally achieved. Output on 21 MHz was also restored. All in all, a good outcome.
I have learned a lot from this repair. One of them is that the circuit from Kenwood has mistakes in it. One that led me on the wrong path for some time until I checked the circuit board against circuit.
You know, I could have sworn it was going to be a band switch problem from all the symptoms it gave and I would have never guessed the faulty components. When you check everything methodically and logically over and over and over again and it still dont work, you know your in a bit of trouble.
So in the end, finding the problem, was it a fluke, lucky maybe? I dont know. What I did learn, was to make no assumptions, lots of patience, be tenacious, dont doubt what you have learned in the past, how the circuit

works and I can go on. I feel great about it and someone more
experienced may have done it in a tenth of my time, but you can never
put a price on what you learn. I am sure the owner of the rig will be
very happy too-No charge.
I know the story is a bit long winded, but I hope that for some of you
readers that may develop this fault later on in the rigs life, you will
save some time repairing it and get it back on air asap.

7921. TS520 screen and cathode resistors

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-07 19:18:56 UTC
From: cybercat321
Topic: 7921 Message: 7921

Hi Folks!

I'm a fairly new listmember and a fairly new ham.

Joined the list when I decided to purcahse one of these Kenwoods.
Been lurking and reading since then.

Ended up with a TS-520 - through E-Bay.
Received with some shipping damage and only the fan seeming to work.

Had the +14 vdc and the -6 vdc but no 9 vdc.
After becoming intimate with the 9 vdc supply buss, found the strip
that grounds the shield of the 12BY7 driver tube had been bent and
was touching the nearby 9 vdc connector.
Fixed that up and now have receive and the led's for vfo mode.
Surprised that the A606 transistor, while running HOT, did not blow.
The HFE on it is one thirty something. If it were bad, I was going
to use ECG 129 but measured HFE low 90's.
Better with the good original anyway!

The cathode and screen resistors for the (GE) 6146A's are in sad
shape.
I haven't tested them yet, but I bet the finals are shot based on
the condition of the resistors.
Although I measure 5 ohms cathode to ground (the cathode resistors
are each 10 ohms and in parallel), both are discolored and swollen
with one having a split from end to end.
One screen resistor looks OK but measures about 112 ohms. The other
is totally open (and looks well BBQ'ed).

I checked the service manual for the TS-520 and it shows the cathode
resistors (R3,R4) as 10 ohms 1 watt.
It shows R2 and R6 (screen) on the schematic as 100 ohms.
The parts list states R2 as 100 ohms but R6 as 10k with both listed
as one quarter watt units.
Here's my dilemma...
all 4 mentioned resistors look (to me) to be larger physical size
than the specified wattage.
I'm also wondering about R6.... 10k ???? I can't read the color code
as it's that badly burned.
Sooo... what's correct for these four resistors (the two cathode
resistors and the two screen resistors).
Am I reading something wrong on the schematic or parts list?
Am I confusing these with two other (screen) resistors?
Those I mention are located very near the 6146A sockets.

Any clarification would be appreciated.
thanx in advance...

- Bill H. / va3hwa
(I receive postings in digest mode so probably won't answer right away)

In researching some help today for a fellow, I noticed something. I have a schematic here for a TS-520 and another for a TS-520S.
I have to ask, Why are the components on the two RF boards labeled differently?

Anyone have an answer?

Subject: [TS-520_820_530_830] Group changes Pt I

Well I spent a lot of time typing up an intro to the group for our new moderators and co-owner, only to have Yahoo eat it. I hope Yahoo got indigestion, big time!

Anyway please let me introduce our new moderators.

Jon KD5SFA has been with me from the beginning of the group, and also is helping on at least two other groups, Amateur-repairs and HAMFTP.

Ellen, AF9J is relatively new to the group but not to Yahoo groups; she moderates two other groups, one ham-related and one not.

Gordon, N6WK comes to us from the SKCC (Straight Key Century Club).

I would like to thank Jon, Ellen and Gordon for stepping up to help. I had several other group members offer to help out, please forgive me if I did not acknowledge each on individually as would be proper. THANK YOU.

Last but not least, please welcome Walt, N9WB as our new co-owner. Walt has been around since I first started forming some of the Yahoo ham radio groups and I think he belongs to all the ones I have started (and one or two I have since left!). Walt is a good moderator and a steady contributor.

Everyone that sent me an email offering help mentioned how great this group is and I would have to second those opinions. We have seen very many rigs repaired and a lot of personal growth and development among our members; this is very gratifying and one of the main reasons we do this.

I don't forsee a lot of changes for the group in regards to policies and so forth. We are currently deciding whether to open up the membership list so that members can "see" other members and contact

moderators more easily; we will do it in such a way that your emails will be hidden from bots and spiders.

Again, thanks so much to Jon, Ellen, Gordon and Walt for stepping up to help out; to all those who wrote in but were not selected, and most of all to all of our group members, who make this thing work!

Vy 73 and God bless,

Bill K0ZL

Topic: 7924 Message: 7930

Gordon,

I googled both the 520 & 520S. There are no real indicators about circuit diofferences between the two. Could it be possible that Kenwood, made circuit changes, when they added 160m capability to the 520S (remember, the 520 didn't do 160)?

Yes Ellen,
That is Very possible. I have been looking over the two
schematics and they label the Final stage components completely
different between the two rigs. Kind of strange because I have never
run into that before with kenwood. I know the 820 and the 820S are
virtually Identical when it comes to that!

Guess we all learn something new each and every day, which is the way
it should be.
73,
gordon

Gordon,
The 520S was a replacement for the 520 rather than an option such as in the 820/820S, so as such, it has a few circuit differences.

7934. Have a Spare AF/AVR RL1

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-08 03:36:58 UTC
From: Bill Marvin
Topic: 7934 Message: 7934

Hello Group,

I located my No Rx problem that being the large RL1 on the AF/AVR board on my TS830S.

Can this relay be taken apart (covers -top & bottm) to clean with DeOxit. Or perhaps someone on list has an extra I can buy.

Thanks in Advance

Bill KB9IV

Bill, Check back a week or so in the Messages. I think that some one here had a simular problem and cleaned the contacts with a 5 dollar bill soaked in De Oxit across the relay Contacts.
I do NOT have a spare Relay for a TS-830 lying around, otherwise, I'd send you one.
I do remember reading in the last 2 weeks about some one using a razor blade to open up the relay on a TS-830 to clean it.

Gordon

7936. TS830S No Drive on 30m

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-08 04:04:43 UTC
From: Ron Hauser
Topic: 7936 Message: 7936

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to come back to them.

I appreciate your coaching.

Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then
your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are
having. I think I've deleted some of your earlier comments on what was
wrong and what does what.

Regards,

7937. Re: [TS-520_820_530_830] TS830S low power

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-08 09:35:40 UTC
From: Joan de vk5kyo
Topic: 6444 Message: 7937

Hi Ron, and also those following this problem

Here is a paste what I sent to Bill some time ago.

Bill the RF choke is normally about 4 Ohms and the faulty one measured 1 Ohm. My guess agrees with your theory in that maybe what inductance was left was resonant to 18 MHz and although the other bands did work, it must have loaded them also because I noticed that ALC was down for 14 MHz and also 21 MHz, but plenty to give full output. As I said, following the replacement, I re-aligned all coils and they all needed adjustment and peaked up better than before. It all makes sense now doesn't it?
Great wisdom in hindsight. I knew I was so close and yet I couldn't see the problem. It was very frustrating and what was worse, I couldn't put the radio down, so needless to say it was very satisfying in the end.
Bill, there is an easy way of checking that RF choke. Lift the top cover and measure the thing. With the radio off. measure Ohms from RF board connector 7, most rear pin to the top of the 470KOhm 1/2 watt resistor lead. That will soon tell you if it is OK.

The above test will measure the Choke. Anything less than 4 Ohms makes the choke suspect.
From memory, measuring the same point to ground will measure the capacitor.
I hope this helps you Ron. Please let the group know your findings.
My theory on why these components may have failed:
L36 - 12BY7 failure, drawing excessive current
C74 - With L36 burned out, it may have failed due to the high RF presented to the bypass capacitor.

May I also add that there are a few older style looking carbon resistors on the 830 RF board, which have a habit of increasing in resistance. I have seen the these increase by 10%, and in some cases nearly 20%. The same problem is found with resistors going high in Swan, Galaxy, Yaesu and no doubt other makes. These radio's go deaf, lack of drive, S meter doesnt work anymore etc. Those restoring older radio's are sure to be aware of this, but are you?

73 from down under, I'm going fishing for a few days
Joan VK5KYO

Bill, Check back a week or so in the Messages. I think that some one
here had a simular problem and cleaned the contacts with a 5 dollar
bill soaked in De Oxit across the relay Contacts.
I do NOT have a spare Relay for a TS-830 lying around, otherwise, I'd
send you one.
I do remember reading in the last 2 weeks about some one using a razor
blade to open up the relay on a TS-830 to clean it.

Gordon

Walt
Can you use both sides of the ten dollar bill and just think of it as
a double faced five dollar bill.

Thanx Gordon!
I thought that was what they should be.
I guess there's a mistake or two in the parts list descriptions.
BTW...
IIRC, I got my manuals from BAMA (thanx BAMA!).
The cathode resistors that are currently in there seem MUCH larger
than 1 W, of course, a previous owner may have changed them.
Either that or it's been so long since I worked with carbon comp
resistors that I'm rusty on recognizing the physical sizes, HI-HI!

7951. TV-506 connecting cable

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-11 05:59:07 UTC
From: alexsen56
Topic: 7951 Message: 7951

Hi everyone,

I have a TV-506 transverter which I want to connect to my TS-520S.
There is a cable connecting the two rigs together from the "X Verter"
jack on the TS-520S to the "6m Control" jack on the TV-506 which I do
not possess.
However, I have the two multipin plugs to make the cable myself.
Since one of the pins carries 160 volts, my question to the group is
if someone knows the pin diagram for the cable.
I wouldn't like to send 160 volts to the wrong pin!!
I've checked both operating manuals but cannot find the connections
anywhere.

Any help will be gratly appreciated.

Hi! I just joined the group. I'm currently studying for my first ham license (Tech w/code), and I've bought a TS-520S for my first rig. It should arrive in a week (bought from a ham on eBay.)

Here's my question: What should I do to inspect the rig right out of the box? I'm somewhat familiar with generic tuning procedures from watching my brother tune his Yaesu FTDX560 years ago. I want to make sure everything is working correctly. I have a mike, a CW key, SWR/power meter, a dummy load, and a dipole antenna (I won't be transmitting over the air until I get my ticket.) I also have a VOM.

Does anyone have a "checklist" of what to do the first time I power it up?

Thanks for any advice!

Leon
Good luck with the exam. Here are a few pointers for the TS 520:
1. Have the manual on hand for tuning purposes!! If you don't have a hard copy then there are a few places on the net where you can download the owners manual. Some will show up asking for $...skip these, then search a little more and you will find repositories that have a free access.

2. Never , NEVER go into transmit or tune transmit mode without a dummy load or correct antenna connected! You could hurt the rig a lot!! When ready, consult the manual and it will give you detailed instructions on how to 'load' her up.

3.You can amuse youself with any length of wire as an antenna for receiving purposes. Just connect the 'antenna' to the center connector of the special coaxial plug at the back of the rig. Twiddle the 'DRIVE' knob to peak the receiver's sensivity as you change bands and frequency.

Hi gang

<< Foxtango.org >> has the small plastic latches used on the 520 and some other older Kenwoods. Go to the '' Visit the Candy store '' page at << http://foxtango.org/FT%20Candy%20Store/CANDY%20STORE.htm >> scroll down to the '' Radio case latches '' and you will find the necessary info.
I asked the contemporary Foxtango founder, W4CLM, if Kenwood owners would be 'allowed' (Hi hi) to purchase from a Yaesu group.
' Of course ' was the answer!

Hi Leon,

In addition to the excellent suggestions, take the lid off and then the cover over the final tubes; check that they are firmly seated and did not get broken. Also check that the driver tube is in it's socket OK.

Check that no packing material made it into places it should not be.

Put the final cover back on; check the back of the rig; see that the SG switch is ON. If it's off, it will keep your rig from transmitting.

Bill K0ZL

Just check that you can get ALC in TUNE mode on 10 meters; that is the most critical band for driver plate and grid tuning. If you can get 50 percent or more deflection on the meter with CAR all the way up, peaking the drive control, you are fine.

Hi Tim,

Like Bob said, you usually don't have to neutralize the 12BY7A driver tube. The only time you have to neutralize a new one, is if things are still screwed up after neutralizng the finals.

7966. TS 530 neutralization

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-12 09:53:00 UTC
From: Walt Breining
Topic: 7966 Message: 7966

Changing the 12BY7 should not change the neutralization. It is the finals 6146 or S2001 that are neutralized so if the neutralization was already OK no change is necessary.

However, if it has been many years since the neutralization was checked, the final tubes might have changed and thus the neutralization may be off.

Here is how to check it.
Tune up the rig in CW by the usual manner into a dummy load or an antenna with a very flat SWR on 28.5 MHz. (must be on or near 28.5 MHz.)

With the carrier control fully up. Be sure that the Plate and Tune are peaked for maximum output.

With the meter reading IC, observe the dip of the IC reading and the output watts at the same time as you slightly move the Plate control back and forth through the dip. What you want is for the output watts to peak exactly at the same point that the IC dips.

Do not leave the rig keyed down for very long at a time. (15 Seconds max) UN-key, let it cool and continue. The reaction on each side of the dip should be fairly symmetrical. If so, your neutralization is fine. If not, tinker with the neutralization capacitor making slight changes at a time until you reach this condition on 28.5 MHz.

The neutralization capacitor has high voltage on it even when the transmitter is UN-keyed. It is best if you can use a plastic tuning tool for the neutralization adjustment. It will have to be removed before observing the dip. Sometimes I find that the capacitor is too stiff for a plastic tool. In this case I place two pieces of shrink tubing on top of each other (double layer) over the shaft of a small metal screwdriver with a PLASTIC handle. Do not use a wood handle. The shrink tubing is to insulate the high voltage from shorting out if the shaft touches the edges of the hole. The plastic handle is what protects you so be sure it is a good insulator!

This is a process of keying the rig, checking the dip/output, UN-keying the rig and then nudging the capacitor slightly one way or another. Then the rig is keyed up again and the results (dip/output) is checked for better or worse.

The cover must be on the final cage to do this. Otherwise neutralization will drastically change when the cage is installed.

Alternate method.
If you have a scope that is good at 28.5 MHz and a dummy load. Connect the rig to the dummy load and connect the scope to read the signal going to the dummy load.
After tuning up the rig, place the SG switch to the OFF position. This kills the rig output by biasing the screen grids negative.

Follow the same procedure as above but instead of observing the meters, adjust the neutralization capacitor for the lowest signal observed leaking through the tubes on the scope. The scope sensitivity will have to be increased during this process.

I usually check for neutralization using the (IC dip/output watts) method. If it looks pretty close, I don't mess with it.

It is normal for the IC dip/output peak to sometimes be off on other frequencies. That is why 28.5 is specified.

Note that for the TS 820 21.350 MHz is specified for this procedure.

Hi all:

I have just purchased a TS-520S and decided to join your group. I got a great bargain on the 520 at a local hamfest as it had issues with noise pops in the audio. To make a long story short the VOX board relay control transister Q8 was leaky and the radio was going from RX to TX at a high random rate when the radio warmed up.

I just finished peaking radio and put it on the air for the first time today and got the normal 520 report. Great sounding transmit audio! Radio puts out over 100 watts and finals seem fine. What a find!

Looking forward to watching this group for tips as I restore this radio.

Topic: 7958 Message: 7969

I went through similar recently after E-Bay purchase of a TS-520.
I'm still working on restoration, slowly, I don't get much time these days.
You might want to "eyeball" (good visual inspection) the screen and
cathode resistors for the finals. These seem to be common culprits in
a lot of failures.
If they look heated, discolored, swollen or cracked replace them.
Measure the actual values if in doubt.

HV WARNING!!!
BEFORE DOING ANYTHING IN OR AROUND THE FINALS, DISCHARGE THE HIGH
VOLTAGE SUPPLY ACCESSABLE AT OR NEAR THE PLATE CAPS!!!

Check the knobs for smooth operation and no mechanical "scraping" sounds.

You could probably get a licenced amateur to give it an "on air" test...
check with a local club for interest.

Gives you something to do while waiting for your licence!

Field Day is Saturday, June 24th. Find a club in your area that's participating and take your new rig (mike, key, swr meter, and dummy load) with you. The hams there will have the exprience you need to check it out. They will also have antennas that can be used to check your new rig on the air. Once it's on the air, one of the hams can make a contact and let you get on the air as third party traffic. Once you get your Tech with Code, you can get on the air on 10 meters and start making contacts on your own.

Hi Larry and Walt,

I can report on these tubes. The Phillips/ECG 6146 W tubes from RF Parts, are the one I put into my baby. I love 'em. They work great. I get a full 100W out of them, and they neutralized out very well. Considering that I got soaked for $57 for a set of garbage Chinese tubes at AES, the $60 I spent on the Phillips/SYlvania tubes was worth it. Besides, if I remember right, they're milspec.

7977. Re: Tube question?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-13 18:26:23 UTC
From: Ellen R
Topic: 7968 Message: 7977

Hi Larry,

I'll try this again. I posted a reply this morning, and it looks like it got lost in the system. I hope this gives you an idea, of what options you have available.

The best finals to use for your Kenwood TS-520S, 820S, 530S, or 830S, are the Japanese, S2001 tubes. Originally your Kenwood hybrid came with these finals in it. If they are taken good care of they can easily last for 20 or more years. Unfortunately they are almost impossible to find nowadays. Kenwoods with these tubes can put out as much as 130W.

If you can't find a set of S2001s, the next best bet is a set of 6146Bs. None of these have been made since the mid 80s, so you will have to settle for a set of used ones in good condition, or New Old Stock (NOS). Unfortunatley, 6146Bs are starting to get hard to find (when I checked with RF Parts back in March, they had no more 6146Bs in stock). Nebraska Surplus still has some left. Be prepared to pay a pretty penny for them. Kenwoods with these tubes can put out about 100-115W.

If you can't find a set of 6146Bs, or the price for them is more than you're willing to pay, you can also use 6146Ws. Unlike what you have been told, 6146Ws are useable in Kenwood hybrids. Many of this group's members use them (including me - in my TS-820). BUT, there is one proviso - AVOID THE CHINESE TUBES LIKE THE PLAGUE! I bought a set of 61246Ws from a major ham radio outlet (they were lableled as Penta tubes), only to find out when I got home, that they were Chinese tubes. Since I had already spent the money on them, and figured, "nothing ventured, nothing gained," I put them in my TS-820. I powered up my rig, and the Chinese tubes flashed over. As a result, I had to replace burned out resistors on both the Finals and High Voltage boards. Not Cool! Whatever you do, do not buy the chinese 6146Ws. They have a dirty vaccuum in them, that makes them prone to flashing and arcing at the voltages Kenwood rigs run at. Either use a good set of used 6146Ws, or go through a place like RF Parts, or Nebraska Surplus, and get a set of NOS, European, or American 6146Ws. RF Parts will tell you not to use GE 6146Ws in your Kenwood. A fair amount of this group's members would beg to differ, since they haven't had any problems with the GE 6146Ws. I myself, bought a set of milspec Phillips/Sylvania 6146Ws for a little extra tube life (and becuase they are a very close approximation of the 6146B), but it isn't necessary to do so. Kenwoods with 6146W tubes can put out about 100-115W.

Thanks to everyone for the info about the tubes...looks like it will be the $59.90/pair, but I will admit that I was tempted by the $39.00/pair...hi..hi. This is a valuable group. Now for another question. I have a 520s that belongs to a friend that has an intermittent problem. Sometimes when tuning, adjusting the drive control causes the rf indication to drop to zero and won't come back. When that happens the audio also drops to a low level. The audio level comes back after turning the rig off and waiting for a few moments before turning back on. Other times the rig loads up normally with 100 watts out. I need some help with this.

Thanks,
Larry - N4HIT

Larry, you can use either. I use the W's unless customer specifies B's; a NOS set of B's is about twice as expensive.

I have seen good tube life from the W's, even with lower plate dis. ratings. They seem to neutralize just fine, but all rigs are different.

Bill:

My name is Gary and call is K4MT and I live in Sevierville, TN. I worked in enginerring for Ten-Tec for a while and have been in the technical field since I was a kid.

If you google around you will find lots of repair info on the ts-520. The exact problem I found was rare but the relay driver transistor is a high failure part. They did not put a high enough capacity transistor to drive the relays and in time they will eventually fail.

Thanks,

Gary

7982. Lost freq stability on TS-820S under 20M

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-15 04:58:56 UTC
From: ke9zm
Topic: 7982 Message: 7982

Its always something...

After some pretty good luck with my TS-820S it developed this interesting problem.

It lost freq stability on 20M on up. Under 20M everything is OK.

For example, right now on 20M my digital display won't lock, its cycling 14.229.x to 14.300.x. Just random digits for last digit.

Needless to say, the transmit is distorted as tested against a local reciever. And, it can't lock on a freq for receive. Its not the digital display - pretty sure its counting correctly and the VFO has gone nuts.

Pretty sure the 820s uses a PLL. So why can't it lock? If the master oscillator was messed then why can it lock on freqs below 20M?

If everything worked, then what fun would this be??

Thanks
Gary / ke9zm

7984. mic impedance

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-16 12:59:04 UTC
From: cybercat321
Topic: 7984 Message: 7984

Hello Group!
I have a TS520 and was wondering about using a matching transformer to allow use of a lo-z mic on it.

I'm considering an Astatic LT-6 which is actually a line matching transformer ('cause I already have one in the junkbox that was used with a Bogen amp).

One end has pins marked as 1)GND 2)COM 3)50 ohms 4)150-250 ohms.
The other is indicated as HZ (I assume that's for Hi-Z).

I'm thinking a 600 ohms (or so) lo-z mic on pin 4 and the Hi-Z side to the mic input on the xcvr.

Comments and opinions, please?

thanx in advance

I just logged QSO NUMBER 820 with my 820, a beautiful radio I've owned since November 2005.

My TS820's S2001s are original--according to research I did with the former owner in Seattle--and seem to be just fine (knock on wood). I treat them with care and carefully dusted out the entire rig as advised. The cooling fan is fine. Cabling is in good shape. All pots and switches have been gingerly cleaned following instructions here described. Little trimmers on boards look a bit 'ancien regime' but also cleaned.

In July I'm going to buy a set of the 'Ws from RF parts that cost $60, and have them on the shelf with the 12BY driver I got from the Surplus outlet. Just in case.

The INRAD CW filter is also the way to go.

I do appreciate the technical and engineering expertise here greatly, and look forward to another 820 contacts. Thanx

Hi Bill,

It should work OK, as long as the the HI-Z impedance output is near the 50K ohms your 520 needs. The audio should be OK too. Some of the most famous microphones used in music, the Shure SM-57, and the Shure SM-58 (my favorite - I bought my own personal one, to use for my lead and backing vocals, in my rock band), basically were the reverse of your situation. They were high impedance mics that Shure put a transformer into, so they could be used with the low input impedance, that virtually every PA made since the late 60s/early 70s uses. They sound so good, that they have far outsold the low impedance versions that Shure finally made of these venerable mics (the SM-43, for instance), which do NOT have impedance transformers in them.

73,
Ellen - AF9J

Hi Rob,

Glad to hear you got the INRAD filter. See, I told you it's better
do do CW with a 400 or 500Hz filter. :) The TS-820 is a nice radio.
I love mine. The receiver is good, and the transmit audio is great.
Ever since I put the new 6146Ws in, and neutralized them, it's given
me a solid 100W out.

7995. Re: [TS-520_820_530_830] Neutralize ts530sp

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-18 11:45:19 UTC
From: Walt Breining
Topic: 7991 Message: 7995

The following has been placed in the Files section of this group.
There are two was to neutralize a Kenwood TS-520, 820, 530, or 830.

First method:
Connect the rig to a dummy load through a T connector.
Tune up your rig for full power in CW on the following frequency depending on your rig.

TS-520 28.5 MHz
TS-820 21.3 MHz
TS-530 28.5 MHz
TS-830 28.5 MHz

After tuning, place the SG switch to off.
Connect an oscilloscope by way of a X10 probe to the T connector.
Adjust the neutralization capacitor for lowest indication on the scope.

Second method:

Connect your rig through a wattmeter to a dummy load or an antenna that will produce a very low SWR at the frequency below. Tune up the rig for full power on CW on the frequency below.

TS-520 28.5 MHZ
TS-820 21.3 MHz
TS-530 28.5 MHz
TS-830 28.5 MHz

Leave the SG switch ON.
Place the meter switch in the IP position. While slighting moving the Tune control, the output on the watt meter should peak at exactly the same point as the IP meter reaches the minimum of its dip. Nudge the neutralization capacitor a bit at a time until this condition is achieved.

Notes:
This condition will only occur on or near the frequencies specified above.

Use a plastic tool if possible because there is high voltage on the neutralization capacitor.

Even if a plastic tool is used, it must be removed before neutralization is checked.

Final unit cover must be in place for proper neutralization.

If you have trouble turning the neutralization capacitor with the plastic tool, a metal screwdriver with a good plastic handle can be used as follows:

Place two layers of shrink tubing over the screwdriver shaft to avoid contact with the outer edge of the neutralization capacitor access hole.

Be sure the plastic handle of the screwdriver is sufficient to protect you from the high voltage. Do not use a wood handle screwdriver.

The screwdriver must be removed completely to check for a neutralized condition.

[:)] Great Day

On this great day of June 18th, 2006 I will wish all the Dads out there a good and happy and memorable day and that all your wishes come true, Yes it is Fathers Day which I call it Dads Day because anyone can be a father but it take a special, cool, caring, loving, and understanding guy to be a DAD.

As for me well I have three children "Kids" whom I am very proud of and sometimes so proud my hats will not fit on my head lol, my first is Becky she is 22 years of age and a full time member of the Oklahoma Nat. Guard and has her own Mary Kay business (which by the way she has mens products too) and she loves dogs and animals, my 2nd is Zachary "ZAC" he is 18 years of age will be 19 come July he is as close a chip off the ole block as can get least as I was when his age LOL, and then there is number 3 Aaron my 16 years of age son he is the more academic one he has to know all about anything that grabs his fancy and he has plans to be a Marine or in the Army a carrier man wow what can I say "GRIN"

Well that is enough bragging on my part better leave some space here today for the rest of you Dads in the group to brag lol, and I hope you do "grin" after all it is OUR Day to do just that and have time with them as well so come on and go on Brag and have a really good Dads Day today.

May God Bless You and Yours this day and everyday.

Allan = kb5doh

For those who often delve in the innards of the 530 series rigs and don't want to take unnecessary risks of damaging self or equipment proper live working electricians insulated screwdrivers are available at reasonable expense eg off eBay.These have a hard plastic sheath all down the driver except for the tip and are rated at 1000V DC use (tested at 10KV). The 7 piece Stanley set I just purchased was around £9 excluding shipping or some $16 which is well worth the piece of mind.
Best 73's to all,

Date: 2006-06-19 01:58:49 UTC
From: valuedprofile
Topic: 8002 Message: 8002

Greetings all, hope everyone had a good Father's Day!

I just found out that I can sacrifice my 29.1 band on the TS-520 and replace that crystal with a 11 meter, or even 60 meter (for MARS operations).

Since I don't use the upper bands, it would be no loss to me and a benefit to be able to use my radio for my MARS operations, albeit not NTIA certified.

Anyone know more information about this? Ideal crystal replacements, frequency of the crystals to be installed (or the manual location), any know issues, etc??

Thank you!

Unless you want to do some major modifications, whatever crystal you put in place of 29.1 needs to be within a few megs of 29.1! The lower bands will not work as the RF tuned circuits are shared among the three ten meter band positions; 12 meters is a bit of a stretch. Of course 11M is illegal to use at any rate, unless you have MARS freqs up there.

I would save pennies and get a good 2nd rig such as the ic-718 (about the best deal on the mrkt for a second HF solid state rig) plus that will give you option of battery and mobile or portable operation.

Topic: 8003 Message: 8008

FWIW, I lifted this text from Glen Zook's (K9STH) 6146 MS Word doc in the files section. If he is correct it appears that most U.S. manufacturers stopped making 6146 and 6146A's a year or so after the 6146B came out.

"Those companies who were manufacturing 6146 series tubes for the military changed from the "plain" 6146 to the 6146A to the 6146B as the military decreed. However, all of the tubes manufactured under military contracts were known as 6146W and, to my knowledge, nothing was done towards marking the tubes as being equivalents of the 6146, 6146A, or 6146B. The only way of telling is from the "date code" which is printed on each tube. Different manufacturers changed tube types at different times. Also, I know of no "master list" telling on what date a particular manufacturer changed from the 6146 to the 6146A to the 6146B. The only "sure" way to know if a particular 6146W is of either the 6146 or 6146A type is to look for a "code date" of before 1964 since RCA introduced the 6146B in the middle of that year. However, some manufacturers did not start manufacturing 6146B equivalent 6146W tubes for at least a year after RCA introduced the 6146B."

I have a few old 6146 and 6146A's in the junk box. I need to check and see if I can find any with date codes newer than 1965.

I have for sale a Heil Goldline dual element microphone Model GM-4

It is in like new condition and has had very little use.

Includes:

GM-4 Microphone with zipper case.

Cable for Kenwood TS-570,870,2000 etc.

Black crinkle finish Heil desk stand base.

New price $210 plus.

Asking $150 plus actual shipping from 05773.

I also have the adapter cable to allow using it with a TS-520, TS-820 seies.

Asking $15 plus actual shipping from 05773.

$160 for all plus shipping.

Thanks for looking.

73,

Bert W1DFU

Good Morning All.

Does anyone have the schematic for the SP-820 speaker circuit that they could email me? Or, do you know a site where I can download it? I can't find it on BAMA or any Kenwood site I know of. Only the SP-230 appears to be out there, and the SP-820 is different. My email is k5gcw@... . Thanks.

Hello All,

I have recently discovered the RF volts control pot on the side panel of my TS-520SE is dirty. I watched my RF output turn erratic after I touched it. I managed to find a clean spot, so I ask this - How do I properly set this control? And after my repair attempt at cleaning the pot (if it fails) is there a source for an original spare?

Regards,

Robert

Geno, you are correct as far as connecting to the speaker goes. But, inside the cabinet there is a passive audio filtering circuit that is connected to 3 pushbuttons on the front panel that select different frequency responses for the audio going to the speaker.

My problem is that a prior owner added another elaborate filter board that he designed that did wonders for his CW operation, but it sounds lousy in SSB operation. He left another, disconnected, smaller circuit board with 3 large inductors and a few "tacked-on" capacitors inside the enclosure, but I don't know if this is the original filter board or something else he added.

The SP-230 has similar switches on the front panel, but it only shows 2 inductors and a single capacitor in it's circuit. I ran a frequency response on the small board with 3 inductors that he left, and the output drops significantly below 2000 cps - so that's no good.

I'm probably going to have to design and build a new circuit, and I'm just trying to find out what the original component values were and how the circuit was configured.

Thanks for your reply Geno.

Cleaning the pot won't fail. Use Cailube MCL, you can get this from Radio
Shack; it's not cheap but it will last you a long time, even the tiny can.

8022. New TS-820 Project

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-21 05:15:57 UTC
From: Gordon
Topic: 8022 Message: 8022

Hi All,
Well I started on my newest TS-820 Project last evening. I received it, Unpacked it and looked it over. First thing I noticed was the VFO plug was missing. So, I made a jumper and jumped pins 8 and 9.
I hooked up my Transformer saver (Thanks to Walt N9WB) and plugged it all in.I hooked up my 20 meter beam, and set the controls at 14 MHZ. I then turned it on... Whoa,,,It was receiving, But the Digital display was off by over 500 KC's. Ok. Turned the rig off and removed the Digital Display control unit. Took the covers off, removed the boards and checked for bad solder joints.... Nothing found, So I sprayed all the connectors and pins with DE-Oxit 5, then reassembled it. Hooked everything back up, plugged it all back in and turned it on... WOW, 14.200 was right on the money.. checked WWV and it also was dead on !
I noticed that the VFO was jumping around as I tuned so, I turned the rig back off, removed the VFO and sprayed the Wiper on the VFO with DE-Oxit 5. Reassembled and fired the rig back up. The VFO is Now clean and smooth. At this pont, I'm a pretty happy guy.
So Today I removed the Transformer saver and decided to try the Transmit part out. Switched my Antenna to Dummy Load. Went to 20 meters, placed it in USB and checked for grid Current..Hmmmm only 40 MA, so I adjusted it to 60 Ma. Then I placed it in tune and adjusted for Maximum ALC with the Drive Control... Looks Good.
Switched to RF and adjusted the plate and Load controls for Maximum output. I quickly noticed that Maximum output and the Plate Dip did Not correspond, So I switched to 21.3 and Neutralized the Finals with the SG switch OFF!
Turned the SG switch back on and checked all bands. My Maximum output now matches my Plate current Dip. Ok.. Lets put this little girl on the Air.
I went to 20 meters as that is the best band for the Evening here to work DX. I heard Ly80Z on 14.177.. Ok, I'll give him a call. ooops, No output.hmmmm OH, Ok, The mike drive is way too low. So I call again and adjust the mic gain up until it stays within the ALC range..
Cool, LY80Z comes back and says .. N6WK good Signal..You are 5-8 here in Lithuania. I gave him a 5-9 and we both moved on. I then heard a DL6LW on 14.177 so I thought, hey , I'll turn the processor on and give him a call. Dang, First call he came right back to me. Gave me a nice 5-9 signal with "Nice Audio" attached. I was VERY happy at this point. I also gave him an S9 as conditions were good here.
Next I came cross a pileup on 14.245... I listened and heard a G7 asking for stateside, what to heck, I'll give him a shout, First call, he came right back, said his call was G7GNM and I was a SOLID s-8 into Hull England and sounded Very Good. I also gave him an S-8 and we said Our Good Byes.

So, I guess this Newest little TS-820 with Digital Display is Ready to Play.
Now I am looking for an 830 that is NON working to play with.

73,
Gordon

Thanks Dave!

First off, I have a real problem with manuals distributed as a series of GIFs or JPGs... you unzip them, and it clogs the platter with scads of files, and you can't tell what you are looking for until you methodically page through them, one image at a time...

So, I took this download, and brought it into one .pdf! Now you can have just one file, open it up, and methodically page thru it, one page at a time, looking for what you need! hi... but at least it's one file.

It will be on RUBE and on the yahoo group files page, if and when yahoo groups comes back up.

Hi Gordon,

I got a look at your finsihed masterpiece. It really looks good! I think the Trio line was mainly marketed outside of the US. Also mine doesn't have the TS-520 style VFO knob spinner that yours, and the other 820S radios have. By the way, you said that you got 120W out. Is that with the original 2001S tubews, or the 6146 series? Gee!! that rig looks good!

73,
Ellen - AF9J

P.S. - Ill try to get some photos of my baby in the group folder, so people can see what I mean about the differences between the 820 and the 820S.

Hi Ellen,
Thanks to all for the kind words.
The tubes had been changed. I thought they were the S2001's as the
output was so good, but they are 6146B's.
The other 820 I have is only putting out a flat 100 watts, I have a
spare set of B's here I could put into it, but I'm content with the
100 watts out on the second one.

Gordon, thanks. Nice scan.

I have copied it to our FTP server RUBE, if you don' t mind.

All about RUBE, the Ham Radio FTP Server at:

www.groups.yahoo.com/groups/hamftp/

Yahoo groups has been clunky and slow, or inaccessible lately. Be patient.

If it doesn't work for you let me know direct.

Thanks for cleaning it up Bill - I agree that a bunch of images is not very convenient. Also, considering my day job is a programmer at Adobe (but not on Acrobat) I should have done that myself, but I had to get to dinner.

Subject: [TS-520_820_530_830] New TS-820 Project

Hi All,
Well I started on my newest TS-820 Project last evening. I received it, Unpacked it and looked it over. First thing I noticed was the VFO plug was missing. So, I made a jumper and jumped pins 8 and 9.
I hooked up my Transformer saver (Thanks to Walt N9WB) and plugged it all in.I hooked up my 20 meter beam, and set the controls at 14 MHZ. I then turned it on... Whoa,,,It was receiving, But the Digital display was off by over 500 KC's. Ok. Turned the rig off and removed the Digital Display control unit. Took the covers off, removed the boards and checked for bad solder joints.... Nothing found, So I sprayed all the connectors and pins with DE-Oxit 5, then reassembled it. Hooked everything back up, plugged it all back in and turned it on... WOW, 14.200 was right on the money.. checked WWV and it also was dead on !
I noticed that the VFO was jumping around as I tuned so, I turned the rig back off, removed the VFO and sprayed the Wiper on the VFO with DE-Oxit 5. Reassembled and fired the rig back up. The VFO is Now clean and smooth. At this pont, I'm a pretty happy guy.
So Today I removed the Transformer saver and decided to try the Transmit part out. Switched my Antenna to Dummy Load. Went to 20 meters, placed it in USB and checked for grid Current..Hmmmm only 40 MA, so I adjusted it to 60 Ma. Then I placed it in tune and adjusted for Maximum ALC with the Drive Control... Looks Good.
Switched to RF and adjusted the plate and Load controls for Maximum output. I quickly noticed that Maximum output and the Plate Dip did Not correspond, So I switched to 21.3 and Neutralized the Finals with the SG switch OFF!
Turned the SG switch back on and checked all bands. My Maximum output now matches my Plate current Dip. Ok.. Lets put this little girl on the Air.
I went to 20 meters as that is the best band for the Evening here to work DX. I heard Ly80Z on 14.177.. Ok, I'll give him a call. ooops, No output.hmmmm OH, Ok, The mike drive is way too low. So I call again and adjust the mic gain up until it stays within the ALC range..
Cool, LY80Z comes back and says .. N6WK good Signal..You are 5-8 here in Lithuania. I gave him a 5-9 and we both moved on. I then heard a DL6LW on 14.177 so I thought, hey , I'll turn the processor on and give him a call. Dang, First call he came right back to me. Gave me a

nice 5-9 signal with "Nice Audio" attached. I was VERY happy at this point. I also gave him an S9 as conditions were good here.
Next I came cross a pileup on 14.245... I listened and heard a G7 asking for stateside, what to heck, I'll give him a shout, First call, he came right back, said his call was G7GNM and I was a SOLID s-8 into Hull England and sounded Very Good. I also gave him an S-8 and we said Our Good Byes.
So, I guess this Newest little TS-820 with Digital Display is Ready to Play.
Now I am looking for an 830 that is NON working to play with.

73,
Gordon

Gordon,

Keep on playing with the TS-820 series, and you'll become as addicted to them as I am. Byt the way, is it a major hassle to get the VFO out? Did you just unbolt it from the front panel, and pull it out?

Gordon, welcome to the '820 family. DE-oxit is your best friend [;)]
I've had my '820 for 29 years -bought it new. The S2001As are original
and I can still measure 100W out on the Bird on 10M.

Back to the VFO problem: Were you able to access the wiper by removing
the VFO shield, or did you remove the VFO assembly through the front
panel? I've recently developed the jumping/intermittant VFO problem
between 300 - 350khz on the dial.

73,

Mitch VE2BAB

Ellen,
There are two screws on the top front and two Screws on the bottom front. Remove the Front Knob and the Face plate for the VFO first. Disconnect the two cables, remove the 4 screws and carefully lift it up out. As you bring it up out, you will want to remove the screw holding the VFO Lamp in place. (I always forget that screw) hi hi.
Pretty simple.
I can remove one in less then 5 minutes including removing the Radio upper and lower covers. Not real hard, I'm just Careful!
To clean the wiper, you just have to remove the side cover on the VFO, no need to remove the whole housing!

Mitch, The VFO had to be removed, but it does NOT come out the front. It actually lifts rearward and up to get it out. Once it was out, I removed the rectangular panel on the Right side (from the front) and sprayed the Rear wiper. I alo added just ONE small drop of sewing machine oil on the front bearing while I was in there. Put the cover back on, reinstalled the VFO into the radio and turned it on to be sure I hadn't moved the rear Dial plate. Once I knew that was Ok, I put the small bezel panel back over the Dial, and installed the Knob. Total time was probably 15 minutes. HINT: place the screws in something to keep from loosing them as a couple a really small.

Maybe I will do a step by step booklet with pictures of each step. ....Hmmm, A new project !

I have a TS-830S and have tried the 6146W and also have tried the 6146B. The difference I see is in neutralization of these tubes. When I neutralize the 6146B then check the power output with the plate dip they both happen at the same time like it should. When I neutralize the 6146W and then check the power output against the plate dip there is a varience of around 10 watts. Is there a way to correct this problem with the 6146W? Neutralization is being done on 28.5.

Hmmmmmm,

Thanks for the info. I was hoping that was the case, rather than having to pull the entire front panel off. Frankly the VFO is behaving itself (especially after I reset VR4 a couple of months ago), so I'll leave it alone. But still, that's good info to know.

Ellen,
Go to http://www.n6wk.com/kenwood/TS-820-VFO--servicing.pdf and I
have outlined the Complete procedure for removing and cleaning the VFO
with pictures.
It is about 12 megs, but worth the download in my opinion.

Hello Group!

As I anticipate another block of "free" time this weekend, the next item to deal with on the restoration of my TS-520 is the impacted (shipping damage) AGC switch.

Yep! It's pushed in (ALL the way!) and is loose inside the cabinet, suspended (I think) by it's connecting wires.

Doesn't seem like I can just pull it out the front, so it looks like disassembly is in order.

Is there a "simple" way to do this? Any tips or tricks from those who have done this before? Any things to watch out for and/or avoid?

Thanx in advance

- Bill H. / va3hwa

Thank you!! That procedure comes in very handy. It also allevaites
any fears that I had, that I would have to pull the entire front
panel off (I have no desire [unless I absoloutly have to] to screw
with the chain drives for tuning nechanisms).

Look for contact parts inside the radio. the tangs that hold it together may have been bent allowing the switch to disassemble itself. There may be some contact parts loose inside the rig and possibly a spring. If you can find all of the parts you may be able to reassemble the switch.

I am new to the group and wanted to introduce myself. I have been absent from ham radio for many years and recently have had a renewed interest in the hobby. I researched all of the latest equipment and nothing moves me like the rigs from my early days. I have decided to try and find an abosolute mint TS-830S and build my station around it. While I wait to find the perfect unit, I will continue to follow this forum to learn about the operation/restoration of my "new" radio. Thank you in advance for your support, and the wonderful wealth of information provided on this forum.

Aloha from Maui Hawaii.

8051. Many misc small accessories for Kenwood rigs FS

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-24 23:16:41 UTC
From: Ken Simpson, W8EK
Topic: 8051 Message: 8051

For Sale:

Misc. small accessory items for Kenwood rigs

Kenwood TU-4 C
Subaudible (PL) encoder for Kenwood TW-4000
This unit provides separate tones for the VHF (2 m) portion
and the UHF (440 MHz) portion. It plugs in to the TW-4000
to provide the tones. No adjustments are normally needed.
This one is in its original box with paper work, hardware, etc.
$65

Small audio plug - round 4 pin with " Y " shaped pin arrangement
This plug was used on many of the Kenwood rigs in the 1970's
to feed auxiliary audio (touchtone pads, etc.) into the rig. It is
about 1/4 inch in diameter and has the 4 pins arranged so they
look like a " Y ". As I recall, this was used on many of the multi
mode rigs (TR-9000, TR-9130, etc.), dual banders (TW-4000,
TW-4100, etc.), and maybe other rigs like the TR-2200. I was
once told that this was "unobtanium", but I found one. $10

Pack of accessory plugs for HF rigs
This is an original packet of accessory plugs, as found with many
of the Kenwood HF rigs. I think this one came from a TS-440, but
it could have been any number of other HF rigs. It consists of a 7
pin DIIN plug, an 8 pin DIN plug, a fuse, a speaker plug, and a
"Calibrator cable." This is original Kenwood in the original bag,
and has never been used. I don't think it was even opened. $12

Battery charge cable for Kenwood TR-2400 HT
This is an adapter that permits one to charge the battery of the
Kenwood TR-2400, 2 meter HT, outside of the HT itself. Usually,
one must have the battery inside the HT, but this lets you charge
a second battery outside of the HT. The original charger is used.
It is in good shape, and works fine. $3

Kenwood PB-21 battery pack for TH-21 / 31 / 41 series HTs
This battery pack does not hold a charge well. Physically it is fine,
but it needs a new "insert" in it. $15

Wrist strap for TH-21 / 31 / 41 and likely other HTs $ 2

Antenna adapter for Kenwood TH-21 / 31 / 41 HTs
This adapts the antenna connector found on these HTs to a standard
BNC connector. $3

Special Rubber Duck antennas for Kenwood TH-21 series
HTs with the threaded connector
Aftermarket stubby, 3.3 inches long $10
Kenwood RA-8 Stubby, 4 inches long $12
Kenwood regular, 6.6 inches long $10

440 MHz stubby rubber duck antenna with BNC connector
This stubby 3 inch long antenna can be used on any of the 440 MHz
HTs that use a BNC connector. $10

Antenna adapter to fit the BNC connector on the HT and provide
an SO-239 connector that will permit a PL-259 to be attached. $5

Kenwood EP-1 ear phone
Used on many Kenwood HTs. Like new. $4

Service manual for Kenwood TR-2600 HT - $10

Prices do not include shipping from Florida.

Thanks.

8052. TS-520 Project

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-25 11:51:35 UTC
From: K4MT
Topic: 8052 Message: 8052

I just went to auto paint store and had them computer match the cover paint. The match was perfect and I have just sprayed the covers. I was shocked how perfect they turned out.

I have a question for the group. The front of the 520 has a thin chrome or silver line. On mine the color has worn off and I need to repaint it. Has anyone figured out what that finish is ie Chrome, Silver etc? Any source for a paint that would match properly? On my VFO-520 it kooks rather thick like it might have been dipped.

hi nip in to the art shop or one office supplier shops
and get yourself one of those silver marker pens medium size fiber nib tip
the use of these pens will give you more control on getting a straight line
than you would using a fine long hair brush the silver will tone down in
time to come now that line can make or brake the job
best of luck

Its fiction.

12AV7 is a twin triode.
12BY7 is a power pentode designed primarily for use as the
video output amplifier in television receivers.

Mike:
Welcome!
In my opinion, the TS-830 is one of the best rigs ever design from an electronic standpoint. It has some mechanical issues but these are easily overcome. These are mostly regarding the bandswitch, but these can be repaired and modified so to not re occur without obtaining another bandswitch. I think that you will love an 830. Very good receiver, especially with some INRAD filters which can easily be done a bit at a time.

I am new to the group and wanted to introduce myself. I have been absent from ham radio for many years and recently have had a renewed interest in the hobby. I researched all of the latest equipment and nothing moves me like the rigs from my early days. I have decided to try and find an abosolute mint TS-830S and build my station around it. While I wait to find the perfect unit, I will continue to follow this forum to learn about the operation/restoration of my "new" radio. Thank you in advance for your support, and the wonderful wealth of information provided on this forum.

Aloha from Maui Hawaii.

Aloha, Mike!

Well if you find one that has a few problems but is unblemished, consider getting it and fixing the problems; non-smoker's rig, maybe broken bandswitch coupling, some of the other issues that are common to these things and are easily repaired; that will broaden your base of available radios and may save you at least the shipping cost.

You can go through the archives (got some free time? hi) and see what common things plague the 830 and then decide how "minty" you want your new rig to be and what things you could possibly accept and correct once it arrives.

A low cost sub for the 12BY7 is the 7054 which was designed for
mobile communications use. The only difference is the lack of a
center tap on the filament making it 12V only. I believe most of the
Kenwood rigs use 12V so it should work fine. Last time I checked
they were selling for about $3.50 each.

As someone has already pointed out, the 12AV7 is a different animal
than the 12BY7(A). The 12BY7(A) is a sharp-cutoff pentode. You
could try a 12BV7 or a 12DQ7. But if you find one of these, it will
most likely be marked with the 12BY7(A) designation as well. -jay, kb9wwq

I went to a local Dupont auto paint store. They have a reader they put on a good area of paint and it gives them the exact formula to mix to get the color. The guys I use are pros and they mix it to have the same amount of gloss and the color was amazing. I have a VFO-520S that had good paint on the case and I used it for them to scan. With the two pieces side by side I can not detect any color difference.

I painted the case with a auto paint refinishing gun Binks #7. It lays the paint on perfectly. For finishes that have a crackle textured look I have found that Krylon sells a textured paint. I have used that as a base coat and put finish on top on those type of cases.

I purchased an INRAD model 80 for my TS 820. It is 2.8 kHz wide instead of 2.4. But it has an extra pole and sharper skirts. I purchased it so I could make the audio low end of my transmit roll off at 150 to 200 Hz instead of 400 Hz by moving the carrier point and not loose high end. But what I didn't expect is that it made a tremendous difference in my receive quality. It did not degrade my adjacent frequency rejection as I had expected. This filter has less bumps along it's curve and rolls sharply once it gets to the end. (sharper skirt ratio). I paid $45.00 for my TS-820. I believe that the $100.00 for the filter was the best money that I have ever spent in a long time.

My preferences may be different than many folks. I tried a 1.8 filter in a TS-820 many years ago and hated it. I found that the little bit of rejection it gave me was not worth the limited audio it caused. I have also found that on 80 and 160, storm crashes are more annoying at narrower bandwidths than wider ones. At wider bandwidths, the crashes are softer and far less nerve wracking.

If I had a TS-830, I would purchase the model 88 and 89 for it.

This is all about SSB, not CW.

Mike:
Welcome!
In my opinion, the TS-830 is one of the best rigs ever design from an electronic standpoint. It has some mechanical issues but these are easily overcome. These are mostly regarding the bandswitch, but these can be repaired and modified so to not re occur without obtaining another bandswitch. I think that you will love an 830. Very good receiver, especially with some INRAD filters which can easily be done a bit at a time.

Subject: [TS-520_820_530_830] Aloha from Maui

I am new to the group and wanted to introduce myself. I have been absent from ham radio for many years and recently have had a renewed interest in the hobby. I researched all of the latest equipment and nothing moves me like the rigs from my early days. I have decided to try and find an abosolute mint TS-830S and build my station around it. While I wait to find the perfect unit, I will continue to follow this forum to learn about the operation/restoration of my "new" radio. Thank you in advance for your support, and the wonderful wealth of information provided on this forum.

Aloha from Maui Hawaii.

A Hui Ho

Mike WA7YET

Very good information Walt, thank you. When I spoke to INRAD, I specifically inquired about the direct replacements for the recommended pair described in the TS-830 operators manual (YG-455C & YK-88C), which ended up being the INRAD 98 & 99. Since I enjoy operating both SSB & CW, I am still undecided as to which filters would be the best. I may just wait and see which mode I end up using the most.

Ellen:

To me it was worth every bit of spending $100.00 on a $45.00 radio. Now my priorities are different from a lot of people. First, I am mostly interested in SSB, although once in a very great while I work CW. I got my Extra when I had to pass 20 WPM before the FCC, but I don't enjoy CW much.

Having been involved in broadcasting and sound for some years, although not so much recently, bad sound really bothers me.
Now, I don't have a big rack of processing equipment, although I am sympathetic with those who wish to do so. Having worked with broadcast processing, using voice and music and multiple channels, I feel this is overkill for me. One voice, one mike at a time, no music, I believe my goals on Amateur Radio can be reached by simpler means like a home brew box like the W2IHY stuff.

I also do some PA work. I hate the sound of a bad PA system in stores and at sports events. I hate the way Letterman's staff mixes their guest bands. Paul Shaffer has it down pretty good, but the guest bands are awful, especially the mixing of the vocals.

I hate to use a cell phone, I don't have one. I prefer my Icom 2 AT over my newer 2 meter radios because the speaker is bigger. It does not sound like an overdriven ear plug.

Now that I have explained where I am coming from, and I understand that I may be a bit radical in this area, here is what the model 80 did for me.

1.8 kHz SSB sounds to me like I have wet cotton in my ears. 2.4 removes some of the cotton. 2.8 removed a bit more and allowed me to hear better, smoother lows.

My original intent was to extend the low frequency response on transmit. A stock TS-820 is about 6 dB down at 400 Hz. I tried changing the carrier oscillator frequency (carrier point) to move this 6 dB point to around 200 Hz. The loss in the high end was critical because the high end cut off is in a critical area for the presence range anyway. Originally, with a 2.4 kHz filter, the 6 dB down point at the top fell at around 2.8 kHz. Changing the carrier point dropped it to around 2.6 kHz. The change wasn't drastic and a typical tin ear person would never tell the difference but I didn't like it.

I figured that the model 80 would allow me to have better lows around 200 Hz instead of 400 and still have top end to about 2800 Hz regaining the presence. But actually, this filter offered even more advantages than I expected. This filter has a much sharper skirt ratio than the original filter because it has an extra pole.

I have noticed that when trying several different stock filters in these rigs that these stock filters vary slightly in their sound on receive. The INRAD has a smoother bandpass between the ends (less bumping) and I could notice the improved sound. I also found that with the carrier point set to pass 200 Hz that there was usable response up to 3 kHz on both transmit and receive.

I had one more surprise. I have noticed that all TS-820s I have used or worked on had a receive audio problem. This is one of those things that just bugs me and nobody else notices. It appears that the AGC does not attack fast enough and overshoots on the initial part of a SSB voice peak. It makes a very slight burst of tearing or distortion at the beginning of each syllable. I have not had the time to pursue this, but I felt that some stage in the IF was overloading during these peaks.

Because the INRAD filter has 6 poles, it has slightly more insertion loss than the original filter. This additional loss corrected the IF overload problem. Because of the noise floor, even on 10 meters, I did not notice any meaningful sensitivity loss due to this insertion loss. I maintain that the overall S/n ratio is slightly better probably due to the improved filter shape.

Another concern was increased adjacent frequency interference with the wider filter. While the window is indeed wider, when it closes it closes faster due to sharper skirts. I maintain that a lot of the adjacent channel problems are in the area where the original filter is 10 dB down. A strong 10 dB down signal can still be audible. While the INRAD filter brings the flat band pass closer to this unwanted signal, slightly farther out it rejects it say 20 dB instead of 10 dB so I believe that my overall situation has actually improved.

On transmit, even though I am slightly wider, I go away fast when I start rolling off so again, I believe my bandwidth at the 10 dB or 20 down point is less wide.

The filter is a direct installation. Usually I leave the filter very slightly (the width of 2 or 3 QSL cards) above the board so solder will not flow up from the pins to ground. You will have to readjust the carrier point and the carrier balance. If you get one, I'll give you some shortcuts and pointers.

I was not able to bring the low end down much farther than 200 Hz. Although this rig has a balanced modulator that suppresses the carrier, more suppression is needed. This is done with the filter skirt. The sharper skirt on the low end will buy more suppression allowing the bandpass to be moved down a bit, but if I go too far, I get inadequate carrier suppression and the carrier balance becomes very critical. It gets a little more touchy anyway but is workable and seems to stay put OK.

I also use a 6 or 8 inch round speaker in a wood enclosure, often with an open back. the wedge shaped DuKane speakers used in PA systems and the speakers used in classroom PA systems when we were in school seem to work for me. DuKane ceiling speakers also work if placed in a simple wooden box. Remove the 70V transformer and go directly to the speaker. Very wide fidelity speakers seem to pass unwanted noise, little ones are too pinched sounding.

Most Amateurs would not notice any of what I have explained above. Most people have a tin ear. Part of it is that they never took the time to train their ear. They never hear the air flowing through a sax, a cornet, or flute. They never hear the fine ornamentation in the strings of stringed instruments. They would never notice that a JT-30 ceramic mike will sound better than a SM-58 on a harp.

I understand from your web site that you are a musician. I bet if you got it adjusted properly, you would tell a difference.

There is another mod where the diodes in the balanced modulators are replaced with Schokey (I probably spelled that wrong) diodes. This is supposed to reduce distortion in the balanced modulator and product detector.

I have the diodes but have not tried that yet.

Isn't that filter a model 88 rather than 80?
I didn't see a model 80 listed on their web page.

I would like to try that filter myself on my TS-820S
so would like to know if the 88 is the correct one
rather than a model 80.

From: Ellen R
Topic: 8050 Message: 8077

Walt,

You've sold me. You answered my biggest concern, which was the bandwidth issue. But since the filter has such steep skirts, I can understand how it can be even more selective than the stock 2.4 KHz filter. Also you did mention some very important things, related to sound fidelity, with this filter.

For starters, the wider bandwidth, means that you wil hear more audio information, wihc gives greater fidelity. MY 820 is NOT my contest machine (I have A Yaesu FT-897 for that); it is my high fidewlity radio. Yes I am a musician. I played brass instruments from 6th grade, until my Sophomre year of college; I also have been playing guitar since 1979, and used to be a lead guitar player in semi-pro heavy rock bands. Most people dcon't realize that hard rock and metal guitarists are usually tone nuts. It is NOT easy (especially live), to get a decent heavy guitar sound. I've always been picky about my sound. I hate shrill sound. I also hate woofy, muddy bottom end. It has to be tight. The gripe you had about David Letterman's sound man - I can understand that, having worked with lazy soundmen, who forced me to take matters into my own hands to get a decdent sound, that I could at least live with onstage (including blowing $160 on my own Shure SM-58 vocal mic, rather than using the soundman's SM-57 [which is only a so-so vocal mic, but a great instrument mic]).

Being a tone maven, I understand your concerns about the TS-820 series audiowise. Stock, the audio is OK, but a bit midrangey for my taste. I have noticed the attack issues you mentioned,when you first hear the other station talk. To me it sounds like a momentary compression of the first syllables that the other ham speaks. I can live with it, but it would be nice to get rid of it. I trust your judgemetn on these sound issues, and it sounds like the INRad 2.8 KHz filter solves these probelms. It looks like I'm going to be spending some more money. Thanks for the info.

73,
Ellen - AF9J

> To me it was worth every bit of spending $100.00 on a $45.00 radio. Now my priorities are different from a lot of people. First, I am mostly interested in SSB, although once in a very great while I work

CW. I got my Extra when I had to pass 20 WPM before the FCC, but I don't enjoy CW much.
>
> Having been involved in broadcasting and sound for some years, although not so much recently, bad sound really bothers me.
> Now, I don't have a big rack of processing equipment, although I am sympathetic with those who wish to do so. Having worked with broadcast processing, using voice and music and multiple channels, I feel this is overkill for me. One voice, one mike at a time, no music, I believe my goals on Amateur Radio can be reached by simpler means like a home brew box like the W2IHY stuff.
>
> I also do some PA work. I hate the sound of a bad PA system in stores and at sports events. I hate the way Letterman's staff mixes their guest bands. Paul Shaffer has it down pretty good, but the guest bands are awful, especially the mixing of the vocals.
>
> I hate to use a cell phone, I don't have one. I prefer my Icom 2 AT over my newer 2 meter radios because the speaker is bigger. It does not sound like an overdriven ear plug.
>
> Now that I have explained where I am coming from, and I understand that I may be a bit radical in this area, here is what the model 80 did for me.
>
> 1.8 kHz SSB sounds to me like I have wet cotton in my ears. 2.4 removes some of the cotton. 2.8 removed a bit more and allowed me to hear better, smoother lows.
>
> My original intent was to extend the low frequency response on transmit. A stock TS-820 is about 6 dB down at 400 Hz. I tried changing the carrier oscillator frequency (carrier point) to move this 6 dB point to around 200 Hz. The loss in the high end was critical because the high end cut off is in a critical area for the presence range anyway. Originally, with a 2.4 kHz filter, the 6 dB down point at the top fell at around 2.8 kHz. Changing the carrier point dropped it to around 2.6 kHz. The change wasn't drastic and a typical tin ear person would never tell the difference but I didn't like it.
>
> I figured that the model 80 would allow me to have better lows around 200 Hz instead of 400 and still have top end to about 2800 Hz regaining the presence. But actually, this filter offered even more advantages than I expected. This filter has a much sharper skirt ratio than the original filter because it has an extra pole.
>
> I have noticed that when trying several different stock filters in these rigs that these stock filters vary slightly in their sound on receive. The INRAD has a smoother bandpass between the ends (less bumping) and I could notice the improved sound. I also found that

with the carrier point set to pass 200 Hz that there was usable response up to 3 kHz on both transmit and receive.
>
> I had one more surprise. I have noticed that all TS-820s I have used or worked on had a receive audio problem. This is one of those things that just bugs me and nobody else notices. It appears that the AGC does not attack fast enough and overshoots on the initial part of a SSB voice peak. It makes a very slight burst of tearing or distortion at the beginning of each syllable. I have not had the time to pursue this, but I felt that some stage in the IF was overloading during these peaks.
>
> Because the INRAD filter has 6 poles, it has slightly more insertion loss than the original filter. This additional loss corrected the IF overload problem. Because of the noise floor, even on 10 meters, I did not notice any meaningful sensitivity loss due to this insertion loss. I maintain that the overall S/n ratio is slightly better probably due to the improved filter shape.
>
> Another concern was increased adjacent frequency interference with the wider filter. While the window is indeed wider, when it closes it closes faster due to sharper skirts. I maintain that a lot of the adjacent channel problems are in the area where the original filter is 10 dB down. A strong 10 dB down signal can still be audible. While the INRAD filter brings the flat band pass closer to this unwanted signal, slightly farther out it rejects it say 20 dB instead of 10 dB so I believe that my overall situation has actually improved.
>
> On transmit, even though I am slightly wider, I go away fast when I start rolling off so again, I believe my bandwidth at the 10 dB or 20 down point is less wide.

Correction:
I am very sorry but I did have the filter number wrong. The correct number
is #88.

the TS-820 series

Isn't that filter a model 88 rather than 80?
I didn't see a model 80 listed on their web page.

I would like to try that filter myself on my TS-820S
so would like to know if the 88 is the correct one
rather than a model 80.

I just got a KENWOOD/TRIO TS-820 S W/A VFO 820....in excellent shape...

I was looking at it...I need some tips and ideas for a antennas...I do not have much room for a dipole...but I would like to build a simple wire antenna for it...I thought about a simple Vertical too...I want to build something on my own...I have Power lines all around the house...around 35-40 high...I would like something simple...I really do not have the Manual for it...

I thank you...Jerry-DE KE7GGV....

There are some manuals here in the file section.
If what you are looking for is NOT here, then Go to
http://www.n6wk.com/kenwood/ and take a peek.
You may download as many as you like.

8083. 820 Problem

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-29 01:52:58 UTC
From: ab8rl
Topic: 8083 Message: 8083

A friend of mine bought my 820 several weeks ago and advised me today it blew a fuse while in receive.

He brought it over for me look over. I removed the covers and I also disconnected the high voltage caps from the 6146W tubes. Powered it up and receiver came on - works fine - no problem.

When I flipped the HEATER switch on , the filement on the driver tube does light - but BOTH filements on the 6146W do not light up.

I placed on HV cap on one 6146W and nothing happened - no issue

I placed the 2nd HV cap on the 2nd 6146W and the tube was arcing in side at the bottom of the tube - it has pitted the tube inside with a burn mark. I immediately shut the power switch off. No fuse blew probably because I didnt let it continue.

Looks right now that I have no FILEMENT VOLTAGE for the tubes - and possibly could have one bad 6146W tube.

I dont have a repair manual so I cant trace.

Any ideas???

Thank you

Tom AB8RL

Tom,
If the filament in the driver works, then you have the 12 volts
needed from the transformer. If either of the 6146's has an open
filament, then neither will light up as they are wired in series with
each other. (6146's) are actually 6 volt filaments.
12 volts come in the (H) terminal on the final board to opin 2 of the
first 6146, then leaves on pin 7 which jumoers over to pin 2 on the
second 6146 and grounds on pin 7 . so, you should have 12 volts on the
"H" terminal and 12 volts on pin 2 of the first (forward) 6146. you
should have 6 volts on pin 7 of the forward 6146 and on pin 2 of the
rear 6146. pin 7 of the rear 6146 should be ground.
Check pins 2 and 7 of the forward 6146. I fyou have 12 in and 6 out...
It's filament is working. If not, it is open.

Sounds to me like the one or both of the finals shorted out. perhaps
from too long of a tune period?? I can only guess.

Looks like you are going to have to have your friend replace one or
both finals.

Gordon

Tom,

Another reason for no current through the heaters is a bad joint on one or more of the heater pins of the 6146 tube-base. The tube-base solder joints go through considerable temperature cycling and may fatigue over time.

I have a TS-530 that I bought with no TX output and a tube-base heater solder joint was the cause.

However, from your description it is likely that one of the 6146s has failed. You will find plenty of advice about 6146s available from this group. I believe that there is universal agreement that you must NOT fit Chinese 6146s. 6146B or 6146W from the major manufacturers, such as GE, should be fitted. Check this group for suggestions about suppliers in the US

I suggest that you should also get a spare 12BY7A at the same time. The life of these driver tubes seems to be less than that of 6146s that are cared for during tune-up.

Welcome to the group, Jerry.

http://www.dxzone.com/catalog/Antennas/G5RV/

Check out the G5RV; 105' of antenna will get you 80-10meters, about 55' for 40-10.

The 520-530-820-830 series will all tune the G5RV without a tuner and do quite well with it; it's a good all-around design and makes FB shortwave listener antenna too.

From: budgiebob2005
Topic: 8088 Message: 8088

Hi all I have two queries
A I use a seperate vfo unit ts820 with my TS 520e all works fine but the VFO reads 10ks High Is it a straight forward adjustment or a proceedure i can find no ref to alignment in the sheets i have downloaded.
B Ts820m I am on final stages off a major service however i have what appears to be mechanical play (up down) on the tunning knob spindel and although this does not shift frequency it spoils the feel off the drive . it looks at first glance that there is either play in the brass drive or possiably some bending off the shaft that connects the knob it shows worse up down rather than side to side . Is it possiable that a s/h replacement may be availiable from a junk box ? Is there any adjustment to remove play ?

Your thoughts please Bob G8ACQ

8089. My second TS-820

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-29 21:55:09 UTC
From: Gordon
Topic: 8089 Message: 8089

Hi guys and girls,

I am still working on this old TS-820. I have discovered that the Grid Bias seems to rise as the rig gets warmer. After 10 minutes, it does NOT seem to go any further. When Cold, I can set the idle bias to 60 ma. I then tune the rig. Output is only about 70 to 80 watts. As a few more minutes go by, I can recheck and get the full 100 watts out, But I then notice that the Bias current has risen to 75 or 80 ma. Turning it back down to 60 still gives me 100 watts output, but the next time I turn the rig on, the Idle Bias is down to 45 or so.
I noticed something today, well actually 2 things. One is that when I switch to USB and check the idle current when cold, it is 60 ma, If I plut a key in the back , switch the Vox on and select send, the CW idle current is 10 to 15 ma Higher... is that Normal?
The second thing I am noticing is that as the rig gets warmer and warmer, the plate DIP does NO longer matches the higest output, but does when it's cool (under 3 or 4 minutes from being turned on.)
Now, I am suspecting finals, but I would like you guys to give me your opinions also.
The Cathode resistors look and check good. Plate voltage (key down under full load) is about 790 volts and at maximum output (about 100 watts) I show 200 -210 ma. I have changed the driver 3 times, but NOT the finals yet. The rig sends out good clean signals on CW and SSB but this varying bias has me puzzled.
Any Ideas guys and Girls ??

I have to wonder if the Big Bearing right behind the adjustment wheel
behind the main Knob is missing?
Does the main Knob turn smoothly, or does it seem a bit "TIGHT "

hallo Gordon
that's one of the problems with these radios problem is your radio had
a lot of ware the ware is in the first vfo plate the one with the window and
four screws holding it on what has happened the ball bearings have worn a
grove in the dicast vfo plate and also the main bearing is plastic
with 10 ball bearings snapped into place
also it is a possibility some one could of lost a couple of these ball
bearings the only solution to this problem is to have the vfo plate turned
out and a ring turned up to and pressed in to the vfo plate creating a new
bearing surface (THEY WERE NEVER VERY TIGHT) to start with
if you have a metal lathe and engineering skills no problem
if take it to an engineering shop preferably a tool maker they deal
in finer work other wise it is a matter of gritting your teeth and
leaving it alone every one of the 820 suffer the same problem and
especially the people who fitted the gold anodized vfo knob they were heavy
I know I have one fitted on mine there is another idea that you can do to
stop the slack is to use one thou shim brass and glue it in to the
bearing surface using araldite the strip would haft to be about 1/8 wide
and cut exactly to length this idea is not for the faint harted very
fiddley
any way check that bearing

Thanks Charles for the Info, But the radio with the Problem is Bob's.
Now if it were worn, as you suggest, Why then would it have more play
"UP and DOWN" then Side to side ? I find this interesting and I
hope he will remove the front 2 dials and let us know what he finds in
there.
I agree with you, If I had a radio with a serious looseness up and
down and side to side, I would take it to my local machinist and have
him machine a new " Bearing Race" for me , but this sounds like a
different problem to me.
Gordon

my apologies Gordon
its all to do with weight
my 820 is exactly the same more up down movement than sideways
I have seen a few like this problem is human not the kinematics of
machinery
any body who is interested the radio is on the desk take hold of the vfo
knob I take it your wrist is on the bench three fingers on the top of the
knob some of us might use one finger or the spinner recess
three fingers the natural weight and the mussels in your wrist are
forcing down on the vfo knob now imagin there is ring/bearing cage
with 10 barring in it approximately each bearing is spaced 3/8" apart
in a plastic baring cage of 1 1/8" bearing cage as you revolve the
vfo knob some time or other time or other all the time if you think about
it
there is only three bearings in contact on the front of that baring housing
which is the vfo dial plate
and plastic baring housing flexes result ware at the bottom left hand
side that's with right handed people with left handed people it the
opposite side now spinner recess has the same thing with a slight
difference you hand weight at the top as you go over center and at the
bottom weight and if you have a heavy vfo knob that compounds your weight
of your hand and weight of the knob now this all sounds highly technical
and mysterious just watch how you operate the vfo some of us grab hold
of it as if it were a car steering wheal hanging on it for grim death
that's where the slop comes from plus they were never precision engineered
they always had slop another example
place an ordinary base ball on the desk how much baring surface is there on
the desk now imagine 1/8" ball bearing working on a flat surface which is
uncuped bad news its nothing to worry about
unless one cant live with it try the vfo of a more modern transceiver
like a ts690 rock solid no slack go back to the 820 sloppy as
ft one Yasue sloppy
this is old engineering my ic735 tight
after all that if it is that sloppy on bobs some one has lost the ball
bearings most likely if not it all to do with weight and how we handle
the vfo
suppose this sounds like a load of old bull dust STOP THINK ABOUT IT

post note
baring rings some of these were made of a dicast metal and the ball
barings had a nasty habit of falling out when they where taken out for
service if that's the case try and find ballbearings the right size good
place to look for them skate board bike roller blades skates one would
haft to check the size with a micrometer first to keep the ball barings in
place when fitting slight amount of grease enough to hold the baring in
place so that they don't fall out when refitting the plate back the
barings you are looking for are about 4mil if it is possible to find some
about 4.2mil the result would be slop nearly gone obvious the 4.2 m
wouldn't fit into fit into the bearing holes a bit of judicious work would
haft to be done here of opening up the holes those of us with model
engineering experience a piece of cake with a set of number drills and
small taper/parallel reamers.....the plastic baring keeper that holds
the ball bearings in place is made in too parts looking at it edgewise you
will see a faint joint ((keep your finger nail out of it)) oops to late
all the little balleys have gone walkabout on the floor I will try and
up load some pictures and perhaps Walt or bill could remove them at some
time or other
Charles & rusty

Gordon, chances are good that one of the final tubes is changing around as it heats up. They are mechanical devices, with significant bit of wire and associated supporting structure; what you describe as a change in neutralization means only that the internal grid structure of one or both tubes is changing with heat.

I wouldn't worry about it, you may have quite a bit of hours left in those tubes. Set your idle current to 45mA cold, and leave it at that; 30 mills is enough to avoid splatter I have found.

If you run only CW you can set your idle current to cutoff and run even more efficiently. Just don't forget to set it back for fone, hi!

From: Joan de vk5kyo
Topic: 8088 Message: 8098

Hi all

My 830 had a terrible feel about it when I first got it. My first thoughts was that something was very loose, but it was just a extremely well used 830. A new plate from Kenwood (if you can get one) may not fix the problem because the shaft is partly worn as well.
In the end I decided not to remanufacture a new plate but rather applied some bush mechanics to it and achieved a brand new feel about it. The process is not difficult. All you require is a blunt centre punch and start marking out about 16 centre punches around the hole. Mark these about 1/10" away from the edge of the hole. If you go closer than that, than it becomes harder to control the shrinkage of the hole. Go around and around with the punch initially with steady force each hit. Check the clearance regularly until clearance is minimal for the shaft. If you go slightly too tight, clean it up with a fine round file. Grease on assembly.
The picture I'd taken is not real good, but should be good enough to get the idea.
I hope the suggestion of applying the hammer to an 830 is not too rough for you.

Regards
Joan VK5KYO

8099. Tune into Amp?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-06-30 16:30:42 UTC
From: Kevin
Topic: 8099 Message: 8099

A little excitement, I guess, about upcoming new one MONTENEGRO -YU6 and
the rusty wheels turning got me to wondering:
For the past 25 years or so, same rig Kenwood TS-830S and SB-220 amp.
I tune the 830 up and if I can't bust the pileup I'll flip on
the amp and tune the amp. I have never re-tuned the 830 into the amp!

So the question: Is it best to tune the 830 again into the tuned
input of this old amp? Different impedence?

It wouldn't surprise me if after all this time I'd been doing it wrong
or at least it could be done better.

I go months and months without using the amp at all, mostly CW now
and not needed. Not like the old days when there was more DX-pileups.

But I am sure when YU6 is busy I'll be inclined to light the filaments
of the 3-500z's again.

Do the same with my 530 and SB-200. Can get a few more watts out if I
retune the 530 but it doesn't make a real difference.

All my information was also pointing to the finals.
Since I am going to sell this rig when I am finished with it, I'll
just order some NEW finals for it and keep the others here for
testing. If I were going to use it here, I would just run these finals
until they pass away :-)
Thanks for the Input.

8103. sloppy vfo knob syndrome

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-01 16:15:55 UTC
From: g1fak
Topic: 8103 Message: 8103

[:-?]

hallo to one and all

i have been giving this sloppy dial some thought

2 fixes first one is ordenary houshold celotape /parcel tape
remove the dial plate check out the grove that the ball bearings have
made clean out the grove and you might notice when new that whole
inside edge where the bearings fit was covered with paint which would of
taken out some of the slack find a nice clean surface and unzip some
celotape about 4" inches long and place on the clean surface first try 3
pieces all stuck together .. right now thats done take a steel rule
and place it lenthwise on the tape next one sharp razor blade (not
for slitting ones rist) using the rule make a cut lenth wise along
the tape then make another cut a 1/4" apart from the first cut now get
the vfo plate ready ... unstick the tape from the clean shiy surface
thats the 1/4" strip now place the strip of tape inside the bearing
housing where the ball bearings rotated making sure that the joint is
at the top then smoth down then cut the tape where it overlaps and
remove the short bit then smoth down one should not feel a lump at the
joint ok so the tape is too wide take the razor blade to it by
cutting the surplus away making the cutting action towards the metal (
not into the hole) cutting from the hole towards the metal using the
edge as a shear this will give you a clean cut do it the other way and
the tape edge will be rough and you will haft to start all over again
smoth down with finge now put the bearing in place where it should go
and slip the vfo dial plate over now things should of tightened up
quite a lot put everything back in place and give it a try also a little
lubrication wouldent go amiss just a drop and a budwiser for the
fixer.....ok this is not a permanant fix its a fix that everyone
can do on the kitchen table its for the person who has limited skills i
tried this out to day on my 820 slack gone as for how long it will last
((dont have a clue)) until those little ball bearings cut through the
tape the the best thing is there is no damage to the plate and it can
be done over and over its an every lady and gentleman fix try it
theres nothing lost and let us know how long it will last?????? second
idea a little later not so simple

My "new" TS-830S is on it's way, and as described it should be in like new condition! Since parts are virtually non existent where I live, I always like to keep some spares on hand. I have already ordered a new set of finals and a driver. I would like to get a replacement bandswitch coupling, but I searched the archives and could not find the OEM part number or where it can be ordered. Secondly, are there other parts prone to failure that I should pick up now rather than waiting until the day they fail? And finally, in an effort to keep this rig working for many more years, does it make more sense to just purchase a second TS-830 and use it for spares?

8105. Will the VFO820 work with my TS-520S?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-01 20:00:05 UTC
From: leonhutto
Topic: 8105 Message: 8105

Can anyone answer this? I would like to use a VFO820 with my 520S transceiver, but I can't find anything that confirms whether these units are compatible.

Can anyone answer and/or point me to a document that gives a definite answer to my question?

Thanks!

8106. Will the VFO-820 work with my TS-520S?

Mike,

You need to go to K4EAA's website. You may find lots of good information. Just look him up on QRZ.com and link to his website.

Bill

Right before you posted I found K4EAA's website and contacted him directly. It looks like he might be a great resource for someone stranded on an island in the middle of the Pacific.

Thank you.

Mike WA7YET

Your VFO 820 will work just fine with the 520. The cables are identical
to the VFO 520.
Enjoy.

Mike,

The part number is D22-0409-05, still available from www.pacparts.com

The old part number D22-0402-05 was discontinued; update your service manual when you get one.

Thank you Bill. Unfortunately, they are now out of stock. I found
that Ken (K4EAA) machines his own and has them readily available.

8113. Antenna Re-use

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-03 00:07:01 UTC
From: digs4ruff
Topic: 8113 Message: 8113

Good afternoon

Walt has been helping me offline but I thought that a few people might benefit from this discussion. If it is too far off topic the moderator can delete it.

I have an old CB antenna I would like to use for 10M. It is a ground plane vertical. I have uploaded photos to the VA7GEM folder. The vertical element is 272cm-275cm depending if I measure to the top of the insulator or to the mounting bracket. The radials are 267.5cms to the centre of the vertical. There is a U shaped connection from vertical to the bracket. I don't know what this is for or what effect it has on the resonant frequency. The SWR currently is fairly flat from 26.000Mhz-29.7MHZ - around 1.3:1

I have been monitoring 28.4Mhz and 28.8Mhz for a couple of days and have heard nothing. I have tried the CB channels as my 2nd rig,an AR-3500 is capable of this, and other than one faint conversation in a foreign language I have heard nothing. Is CB still used. I am at 1000' elevation overlooking Vancouver so would expect to hear some traffic.

My Kenwood dip meter indicates a dip at 31.5Mhz.

The question is should I just use the antenna the way it is or is there some changes that need to be made.
Thanks
Barry VA7GEM

G'day Barry

I would use the antenna the way it is or put up a simple 10 meter dipole antenna, i.e half wave or a full wave, which is rather like an end fend diople, fed one quarter wavelength from one end with three quarters of a wavelength on the other side of the antenna.

Best to use a 4 to 1 balun and coax to feed this type of antenna, and they have useful gain, about 5dbd.

As for the use of CB,

here is Australia HF is very quiet at the moment, I am a licensed VK2 operator and HF is quiet everywhere.

On the cb band the usual people are around but only about half a dozen.

When the DX is rolling in it picks up a bit.

10 Meters is dead at the moment as well, but it will pick up.

At 1000 feet you should hear something, although it may be that vancouver has very littel cb traffic compared to the United States.

If there is no sun spot activity you would only hear local stations anyway, if there are very few around, as it seems, then the silence is normal.

I know people who can communicate from one side of Sydney to the other now on 12 watts ssb, a distance of around 60 kilometers of 37 miles, because the band is so quiet.

Not like the late 70's!

73
Anthony

8115. Antenna question...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-03 00:48:50 UTC
From: kc2aup@arrl.net
Topic: 8115 Message: 8115

I have a question for the group.....

I have not yet experienced the use of a long wire. I am used to using a dipole set up on my roof for HF communications. For the past 6 years or so, I have had nothing but good luck with this.

I had 4 sets of dipoles for the 10 thru 40 meter band fed into a 1:1 balun about 35 feet up and run 50 feet of coax to my shack. Never had a problem. I replaced the wires about 2 years ago and fine tuned everything. Seemed like the wires stretched out a little.

Now for my question. I had sell my house and move into a condo complex. There are antenna rules here for external antennas. I trust some of you know what I am talking about. However, my back door and deck face the woods. Someone told me to just throw up a 200 foot wire over the tops of the trees and just let it hang wherever it lands. (I am going to tie there wire up to an arrow and shoot it over the trees to get the distance.

The other end is going to come down into a connector. I guess I would solder the wire to the center conductor to a female type PL258, mount it to a plate and hook it up to a ground rod in the ground. A piece of coax will bring it into the house for operations.

Will something like this work? Like I said, never used a long wire before...

G'day Frank,

it will work, it is jusyt a random length wire antenna.

I would make sure that it is at least a half wave long on your lowest operating frequency, i.e 160m, 80 meters long etc.

Make sure that there is a good earth attached to the outside of the pl259 connector.

You will no doubt have to use an antenna tuner, but it should tune up fine and should resonate quite well!

good luck

Hi Frank,

As Anthony said, it'll work. I can verify this first hand. I've been funning variations on this theme for an antennas, since the mid 90s. Basically, it's a 1/4 wave or longer on 160m, and I run as long a counterpoise as I can, and use an MFJ Artificial Ground (basically a counterpoise tuner). It works well on some bands (especially the higher HF bands), on some bands (typically 80 & 160m), it only gets by. But I do put out a signal on these bands.

73,
Ellen - AF9J

THIS IS KE7GGV...I have a KENWOOD/TRIO TS820 S....I do not have much height for a G5RV...because of many powerlines on my small home/lot...

I was thinking of a wire"homebrew"antenna or such...because of the height required....or would a VERTICAL work what would work the best..I plan to use 10-40M..Maybe up top 80 M...something easy to build...as my first antenna...I WELCOME ANY IDEAS...TIPS OR PLANS...thisis my first HF rig....

I do have an extra SWR/TUNER...I am open to suggestions or plans...that I can be proud of to build...

On RIXPIX it says this model goes up to 100 watts but in the Manual it says 200 WATTS PEP....what is the lowest power output....

I am limited by height....would a random wire work...

I thank you..please write...THX-DE-KE7GGV-73

Write to me at

ke7ggv@...

I also welcome any WORD DOC or PDF FILES for antennas...that are either stealthy or will help me...AGAIN I THANK YOU...

G'day gerald.

A good long wire antenna at about 20 feet off the ground with a good earth would work wonders, as for power output, the Kenwood has an INPUT of 200 watts, and output of 100 watts.

Only a handfull of HF radios put out 200 watts,

I have an icom 751 that puts out about 140 watts and a TS120 that tops at 125 watts, but they are both rare, radios like the old Yaesu FT200 DX, do put out 200 watts, but the difference between 100 watts and 200 watts is very littel at the recieving end.

Believe it or not.

hallo Gerald I realize you wont to make your own antenna
the best antenna for limited space is a butternut HF6V try and get hold
of a second hand one and rebuild it and work it at ground level 32ft high
then experiment with traps dipoles magnetic loops and EH antennas
with a postage stamp size yard a good manual a.t.u. roller coaster
I think you will find that piece of equipment a must personally I would
stay away from automatic atu you will have more control with a manual
a.t.u.

Good Morning Frank;
When I first got my license, one of the guys I worked with gave me my 1st station, a home brewed receiver, a Heathkit Apachie, about 150 ft of cross connection wire and a homemade LC tuner. To make it short, I ran out 135ft of wire, probably 15ft off the ground, it wasn't even close to being in a straight line. One end was skinned and stuck under a clip and then I moved the clip to different spots on the coil and adjusted the variable cap. until the sound was loudest in the receiver, and don't forget, this was using a manual T/R switch! Hey!, it worked great on 80 and 40 but nowadays I wouldn't dream of trying that without someway of checking the SWR. The ground was nothing more than a wire hooked to the radiator. I still don't know how I survived, luck I guess.

For many years ran with a wire that went thru a hole in the wall, up the side of the house, across the roof and then down to the fence in my small back yard. Altogether about 100 feet of wire. Used an MFJ tuner with my TS-530s for operation on 80 thru 10 meters. Worked the world with it.

Frank,

I have 130 ft approx long wire that goes into a small wood at the rear of my shack for almost all of its length. However, it is tied to various branches using antenna insulators rather than resting on branches. I tune it up against mains earth. The average height is about 10 or 12 ft and works well. It is very good for working around the UK on 80m and I have managed UK to USA on 80m and 160m.

One downside is that I have to cut back the tree growth around the antenna once a year!

Although pi-networks allow you to tune into a wide range of antenna impedances, I recommend that you use an ATU (I use the AT-230). I had to wind an air-cored auto-transformer to get match on 80m with the ATU because the impedance is so high (being almost exactly a half-wave). I use black PVC insulated wire and the antenna is almost invisible - I couldn't see it last weekend and I know where it is....

I also have a 20m dipole at a similar height and that antenna works well Don't be discouraged if you can't get your antenna very high.

Hi Bill and Group,
I received my New 6146W-MP Phillips/ECG Matched tubes from RF parts this morning. I put them in, set the bias current, neutralized them and then checked how much bias I could crank up to (Very QUICKLY). I now can get 200 ma of bias, but I set it back to 60. The tubes are giving me about 120 watts out and the bias stays steady now. Also, output is the same Hot or cold.
Bill, you and Walt were right. It was the Finals.
Thanks again for your advice guys. Looks like it's time to put the covers on and use the rig for a bit before I sell this one.
Now I am waiting to get the 830 I have coming this week to start another project.
73,
Gordon

Hey guys,

Sorry about this.

I need to aks two questions,

1) I have a TS820 that is deaf, not totally, but no where as good as my 520,

I have tuned everything up as per the service manual, but it is still deaf, any ideas what to look for next?

I have thought maybe bad caps, but before I start replacing everything I thought I would ask around to see if anyone else had the same issues?

2) I have to neutralize the finals in the TS520, that just cooked the finals and driver, but, call me dumb, I can't work out the sequence from the service manual, my copy is quite bad and difficult to read, any tips/

Thanks guys

Tom,
I am pretty sure that the Only difference between the TS-830 and the TS-830 "GOLD" is just the GOLD. ie. The gold Lettering and the Gold Knob. I know of NO other Differences in the two rigs !

Anthony,
I would think perhaps some bad contacts in the switches might be
causing your Low receive. Try cleaning all the band switches with De Oxit.

Also, If you can't read your manual to neutralize the finals, go to
http://www.n6wk.com/kenwood and download the TS-820 service manual or
the ts-820 Users manual. They are legible and give you a step by
step. Neutralizing the Finals is Really VERY easy, but Be Careful !!
HIGH VOLTAGE in that Cage !!!!

Gold Knob is got to be worth something. All my knobs are plastic.

Original Question:
NO DIFFERENCE

But some may feel better, and demand more money, when they're trying to
sell one.

The gold knob (KNB-1) was an option. To the best of my knowledge, it was never standard on any model.

I could be wrong -- wouldn't be the first time.

Tom,
I am pretty sure that the Only difference between the TS-830 and the
TS-830 "GOLD" is just the GOLD. ie. The gold Lettering and the Gold
Knob. I know of NO other Differences in the two rigs !

73,
Gordon

Anthony,
I would think perhaps some bad contacts in the switches might be
causing your Low receive. Try cleaning all the band switches with De Oxit.

Also, If you can't read your manual to neutralize the finals, go to
http://www.n6wk.com/kenwood and download the TS-820 service manual or
the ts-820 Users manual. They are legible and give you a step by
step. Neutralizing the Finals is Really VERY easy, but Be Careful !!
HIGH VOLTAGE in that Cage !!!!

73,
Gordon

Hi D.W.

Maybe this will help you. It's sort of a table.

RIG Bands Comments

TS-520 80-10m First in the 520 series. Options -
External VFO, desk mic, external speaker.
NO optional transverters. NO monitor scope, NO
phone patch. NO digital display unit.

TS-520S 160-10m Next in the 520 series. Options - external VFO;
6 & 2m transverters; desk mic; external speaker;
monitor scope; digital display unit; 500Hz CW
filter. NO Phone Patch

TS-520SE 160-10m Last in the 520 series. Options - external VFO;
external speaker; desk mic; digital display unit;
monitor scope; 500 Hz CW filter; phone patch.
520 SE has NO back jacks for the 6 & 2m
transverters available for the 520S. NO
transverters were marketed for the 520SE.

73,
Ellen - AF9J

8139. Re: TS-820 HV Filter Capacitors needed

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-04 05:56:01 UTC
From: Mike
Topic: 8127 Message: 8139

Tom,

I just replaced the filter caps in my 830. I'm betting they are the same ones in the 820.

The original caps were labeled...

Marcon CE 60 W-A
100uf 500wv
Neg Black
1S20A

The Kenwood part # for C22, 24 from the 830 schematic is C90-0327-05. I couldn't find anyone stocking this part #.

I searched eBay for 100uf 500v capacitors and found these...

eBay item # 7616798092 (plug that number into the eBay search bar)

They are a bit pricey but they are nearly a perfect fit. The original clamps that hold the caps to the chassis don't quite close as far. (These caps are a tiny bit larger in diameter.) I had to drill a new hole in the chassis for the screw on one foot of each clamp. It sounds worse than it is. When finished the caps look like stock parts and are working fine.

This was on an 830 remember.

Hi Everyone,

Recently purchased TS830s which I have re-aligned and is now working pretty well. What I do remember seeing some time back when I lived in the UK was some Kenwood colour TS830s spray paint. - I need to get the upper and lower lid re-painted as they are in a real mess.

Can anyone point me in the right direction please?

Regards,

Chris Parnell

Anthony, in addition to Gordon's good advice, you should definitely read Walt N9WB's comments on neutralization in the files section of this group. Actually read three of Walt's articles: Danger High Voltage, Save Your Power Transformer, and Neutralization.

I found those three to be very helpful in addition to the information in the 820 manual.

Possibility of solder bridge somewhere that is intermittantly connecting
both the narrow and the wider filters in parallel; check the board where you
installed the filter. Also if it's an 820, take a look at the IF unit
connections on the bottom of the board; there is a jumper that you move to
enable the CW narrow filter; it could be loose or dirty, or it could have a
bit of a wire "hair" on it that is shorting

The RF OUT meter reading on these rigs is relative; tune for max output into a dummy load and adjust the RF OUT pot in the back, upper right corner as the back is facing away from you, for about 80 percent deflection of the meter.

Then, if the meter pegs going into a real antenna, you know you have an swr problem; if it reads way low, you have a tuning or rig problem.

Look in the Databases section of the group and open up the parts database;
the caps are listed there. The Digikey number is exact diameter.

This is probably the dumbest question on the board. I finally got my new rig. Being excited to hear it work, I hooked up a piece of coax, attached about 50 feet of 24 ga solid bus wire that I had in my shack to the center pin of the PL-259, threw it over my 5th floor lanai, and.....NOTHING. Is it possible this very small gauge of wire is not enough to bring the sweet sound of your voices from around the world?

Mike,

If you were just listening, did you peak the drive control for
maximum noise/signal? The circuits in the Kenwood hybrids are NOT
broadband. In some cases, if you're really way off of the peak, you
will literally hear nothing. Also, don't forget that you're 2500
miles from the mainland. At this part of the the solar cycle, condx.
are noting to write about. If it's light outside you may have to
listen on 15 or 20m, but even then you may have iffy days.

Initially I had forgotten how narrow these rigs are, but I did
finally think to peak the drive, which brought up the noise but no
signals. I will continue to listen on different bands at different
times of the day until I have a chance to attach a real antenna.

RF gain turned all the way up. Can you hear the calibrator? Is it oxygen
free wire? Did you adjust drive control for maximum noise?

On your previous question, Shaft Couplings:
Go here, they have them:
http://www.surplussales.com/ShaftHardware/ShaftH-8.html

Or try your local hardware store.

As well as the differences mentioned, there were some that had the 12 VDC power option built in.
I recall seeing a comparison of these somewhere on the web when I was researching my preferred initial purchase of one of these radios.
I'll see if I can find it...
no promises, though
- Bill H. / va3hwa

What is the difference between a
520, 520S and a 520SE ?

Pete

RF gain on max, now using a very short piece of stranded copper, drive control set for maximum noise, no signals found on any band. I am trying to track down another ham on the island so I can try it on a real antenna. The physical appearance of this radio is absolutely perfect inside and out. I have a hard time believing it has any problem other than my antenna, but coming from eBay you can never be sure.

Thanks for the link for the shaft couplers.

Anthony, in addition to Gordon's good advice, you should definitely read
Walt N9WB's comments on neutralization in the files section of this group.
Actually read three of Walt's articles: Danger High Voltage, Save Your
Power Transformer, and Neutralization.

I found those three to be very helpful in addition to the information in the
820 manual.

Anthony,
I would think perhaps some bad contacts in the switches might be
causing your Low receive. Try cleaning all the band switches with De Oxit.

Also, If you can't read your manual to neutralize the finals, go to
http://www.n6wk.com/kenwood and download the TS-820 service manual or
the ts-820 Users manual. They are legible and give you a step by
step. Neutralizing the Finals is Really VERY easy, but Be Careful !!
HIGH VOLTAGE in that Cage !!!!

73,
Gordon

Mike,
Be sure that you do not somehow have a short in the PL 259. Try skinning down the end of the wire and connecting it directly into the center of the antenna connector on the back. You should hear well on a 50' wire if signals are there.

On exactly 10.000 MHz USB or LSB you should hear WWV at some point at the day or night either from Colorado or from Hawaii. They transmit from both spots simultaneously.

I would think that you would hear signals at night on 40 meters from broadcast stations, just as it is getting dark there or just as it is getting light.

The idea of seeing if you could hear your crystal calibrator was a good idea except that I don't think that the TS-830 has one.

There is a crystal calibrator on the 830, engaged by turning the mike gain all the way down until it clicks. So you should hear that... you should hear _something_ with a 50' piece of wire. You should hear static crashes on 80m after dark!

Hi Chris,
I just happened to find some "Original Color" Paint for the 820 and
830's on Ebay. It does NOT however, duplicate the original "Texture",
but the Color is an Exact match.
I have a couple of extra cans if you can not find any down there. It
was a bit pricey when I bought it though.

What is the preferred final tubes for the 820 and 830???

Is the 6146B ok matched pair??? or 6146W??? RF parts does not recommend the GE 6146W for Kenwood transceivers - the ECG/PHILLIPS 6146W is pricy at $59/pair.

R&L carries the 6146B through Jetstream $39 for matched pair.

???

The tubes are in parallel. What's the point of a "matched pair"? One misnomer is that they will age at the same rate which is highly unlikely. I've never bought a pair of "matched 6146's" for any of my rigs and I've been using 6146's in my finals since 1959 and have never a problem. If I need two 6146/A/B/W's, I just reach into my hamfest tube stash and pull two of the same code out. Most, if not all, were bought new, but have no idea of their history.

A friend has a TS-520SE and he is calibrated on 160 meters but on 80
he is about 20 kcs off.He needs to buy two switch paddles that broke
and would like to know the source for these paddles.
I have used several TS-520's and never had this problem.
I have a TS-520S and I love this radio. Have more modern radios but I
just get a kick using this old but great radio.

Mike,
Be sure that you do not somehow have a short in the PL 259. Try skinning down the end of the wire and connecting it directly into the center of the antenna connector on the back. You should hear well on a 50' wire if signals are there.

On exactly 10.000 MHz USB or LSB you should hear WWV at some point at the day or night either from Colorado or from Hawaii. They transmit from both spots simultaneously.

I would think that you would hear signals at night on 40 meters from broadcast stations, just as it is getting dark there or just as it is getting light.

The idea of seeing if you could hear your crystal calibrator was a good idea except that I don't think that the TS-830 has one.

This is probably the dumbest question on the board. I finally got my new rig. Being excited to hear it work, I hooked up a piece of coax, attached about 50 feet of 24 ga solid bus wire that I had in my shack to the center pin of the PL-259, threw it over my 5th floor lanai, and.....NOTHING. Is it possible this very small gauge of wire is not enough to bring the sweet sound of your voices from around the world?

Maybe Walt, N9WB or Bill, K0ZL, can answer this.

For the last several days when I post a message to the board, I don't get a copy of it and I don't always get other messages to this board. I checked membership on Yahoo Groups and individual e-mails to this e-mail address is checked off. I can see my messages got posted on the board by going up to Yahoo Groups. I also checked member status and it doesn't look like Yahoo is getting bounced e-mails back to them. Anybody got a clue what's going on?

Hey Gordon,

That sounds great buddy.... I know that I got some from ebay for an old 520SE that I restored in the UK but cannot find any here in (or around) New Zealand.
So if you can let me know what it will cost me to get your two cans here that would be fantastic. - I am not too worried about the texture as that would be nearly impossible to re-create.

I am located in Auckland.

hallo Chris
to get the correct texture is simple (but cannot be done using cans) can paint is at the right consistency to flatten out when applied and this creates a smooth finish also the original paint has a certain amount of matting agent applied to kill the high gloss.....if you want to be a perfectionist take your top and bottom panels into the local auto/chop shop /spray shop tell them you require an orange peel finish and an exact colour match or if you are in UK halberds and get a computer match and give them strict instructions not to thin the paint too much once you have the paint in your hands then you can go to the local spray shop oooooo or use your own compressor and spray gun
how to get orange peel paint affect/////// the paint has to be sprayed on the surface a lot thicker the paint comes out of the gun in minute thicker droplets as the droplets hit the surface they stay in a droplet form and start to skin over immediately this causes high & lows in the painted surface and the affect is orange peel highly frowned on in the motor trade the thicker the paint the heavier the orange peel
before using the top coat remove all paint down to bare metal
not a good idea to use sand blasting this will only distort the panel used by the non professional its possible to get a permanent twist in your panels millions of tiny particles bombarding one small area tends to stretch the metal hence a twist appears have it done professionally and give them strict instructions not to cause a twist in the panels
once you have that done a good etch primer what this does bites its way on to the metal this etch primer is the medium that your top coat will bite its way on to the reason for this is if no etch primer is used and you spray your top coat straight on to the metal ((you might create a perfect finish)) but some where down the track chips will start to fall of with the slightest knock
plus if you have this done professionally they have drying ovens and this tends to make a harder and more durable painted surface
well after all that I still use spray cans with the paint as close as match to the original paint I have it made up for me with matting agent in pressure pack form

Hi Pete,

I checked your settings; you are not being moderated. I checked group settings; only new members are set to be moderated the first few posts. Then we change them to unmoderated.

Yahoo servers are overloaded and the code they run is so bloated that it takes 3 seconds for each screen to load; that's bad when you have 13 groups and 15 new members to approve, 12 message to approve; etc etc... oh well

Not sure what's wrong but they have had problems like this before.

Topic: 8169 Message: 8169

Does anyone have an old TS-830 that they are parting Out ??
I am interested in either buying the whole rig, or just some Boards....

I received my TS-830 yesterday. I gave it a quick look over. It is in VERY nice shape cosmetically. However, I receive NO RF and the rig does NOIT transmit. Not even any Idle Bias on the Finals.
The AF part works as I hear lots of "White Noise" (Scary Movie by the Way) and I can adjust the Volume up and down. When I click the Calibrator On,... Nothing ! No beat at all. I have noticed that the First RF amp has been changed on the RF board. I went to the Electronic store today to buy a New 3SK73(GR) but they did not show a Cross for it.
So, My question now is, Does anyone Know what the Correct cross is for this MOSFET, or is there Not one ? I checked the Voltage on Q1 and found the Drain is 12.15 volts (supposed to be 12.4) the Source is 7.5 (supposed to be (1.0) G1 is 1.1 (supposed to be 1.1) and G2 is 2.7 (supposed to be 2.7). So, The Source is High, But I'm not sure which direction to look for WHY !
Any help guys ??

Hi Pete,

You don't need to use a matched set. It's just that a matched set is easier to neutralize. In some cases, if the tubes are too mismatched, they will not neutralize out properly, because the neutralizing capacitor will not have enough range to do so.

Just finished xmit section and recv section on my 820
s, but have the DG-1 problem to tackle left.
the display is ok except for the mhz digit, it displays 9.xxx,19.xxx
or 29.xxx. SM say to check input signals to counter bd, well my VTVM
is dead in the water, but looks ok on scope.(old scope). The digits
below the mhz follows the vfo perfectly and dead-on(checked with
external Cal'd freq counter.ex: 19.180 in 14mhz position would be
14.180mhz on dial and reads 14.180 on ext counter. Iam not the best at
this IC troubleshooting, but I thought I would throw this out to the
group and hopefully someone ran across this in the past.
By the way put in a pair of 6146w's matched(ecg/philips) about 10watts
less on power mtr. 110watts out on all bands. Iam happy.

Don,
I have run into this problem. Removing the DG-1 unit, taking off the covers, separating the boards and cleaning ALL the contacts with De Oxit completely Solved the Problem. I also recommend spraying the Rear Wiper/Spring on the VFO while you are at it. These units are also noted for bad/cracked solder joints inside the Unit. I have yet to find one with BAD solder joints but Dirty Contacts, I have found Many Times.

It's probably a juno issue.
I know gmail blocks messages that you send to the
group and then get sent back to you, they think you
wouldn't send yourself an email. Maybe Juno does
the same. Beyond that if they are getting posted to the
group and you aren't getting any and you are not bouncing
then Juno must be blocking them. Check with them...

Pete,

You might want to check with your ISP as well. I moderate several Yahoo! groups myself, and I have had similar complaints. Many are as a result of ISP spam filters. In one instance, I was not getting some posts, or getting them delayed by a couple of days. I contacted Yahoo! and they said that the messages were not being delayed there, and I was able to verify that through the header info. I then contacted my ISP (Bellsouth), and they verified that their filtering was delaying or even deleting some posts. Their engineers adjusted their SPAM filters, and all was well.

Apparently, the problem is that so many spammers spoof Yahoo! addresses that many filters either treat Yahoo! domains as highly suspect or block them altogether. This is a real problem with my Wildlife Attorney reflector because all the members there are government attorneys, and every time there is a spamming software upgrade, somebody starts having problems.

FWIW, just like this one, all the lists I manage require moderator approval specifically so spammers can't get through. The price of "progress" I suppose.

Good luck,
Norman

Often wondered, when you receive an ordered set of "matched tubes" from a vendor, does it include a written certification that the tubes are matched and what parameters were matched (i.e. transconductance, Mu-Factor, interelectrode capacitances, etc.) or do you just receive an invoice that says "matched tubes" at $XX?

Pete, wa2cwa

8177. Matched Tubes.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-07 18:46:10 UTC
From: N3DOK
Topic: 8177 Message: 8177

Hi, The information listed below is from Web Sites found under. Google search for: How do you match tubes. Some of the information list is from audio and instrument amps .

Bob N3DOK

http://www.google.com/search?hl=en&q=+How+do+you+match+tubes&btnG=Google+Search

Matched tubes: A pair, quad or sextet of power tubes that draws an equal amount of current, measured in milliamps (mA). *Note: tubes are also matched for transconductance, but this article focuses on current draw.

Tubes are matched to maximize an amp's power, tone and reliability. When tubes are not matched, bad tone, low output and/or short tube life can result. For example, say you have a pair of 6L6's in a Super Reverb (normal current draw between 25mA & 35mA per tube); one tube is drawing 40mA and the other 12mA. This mismatch can cause weak output, crossover distortion (a non-musical distortion) and a loud hum. Additionally, the tube drawing 40mA will wear out more quickly than the one at 12mA. This type of mismatch is extreme, but possible.

Tube Matching: We match tubes using a Hickok 539C tester. Power output tubes are matched for plate current and transconductance (within 5% for both parameters). Small signal tubes are matched for transconductance (within 5%).

3. Why do you match power tubes?
Many amplifiers are designed to require power tubes that have similar cathode current. Even tubes of the same type made at the same time will have variations in their cathode current, and this is why testing and matching is required. Please note that not every amp actually requires it - but it never hurts to have matched tubes. See this answer for more info about whether you need matched power tubes.

4. How are power tubes matched?
Power tubes are paired up based on their current draw, or "plate current". Measuring plate current draw under operating conditions is generally considered to be the most accurate method for rating a power tube, and it is the method we use.

5. How accurate is your matching?
We match tubes to be within 5% of measured plate current (that is, the tubes won't differ from each other by more than 5%, or 1 milliamp in 20). Despite what many people may say, this is about as accurate as power tubes can be matched. Tubes will always test differently from day to day because of fluctuations in the power supply and "drift" in the tube over time as it ages. When you consider that most electrical components in a modern amplifier are built with a tolerance of 10%, this is more than accurate enough. By contrast, common practice in the tube industry for the last fifty years has been to match power tubes to within 25%.

6. What does the Perfect Pair number mean on my matched power tubes from thetubestore.com?
The Perfect Pair number is the actual "plate current" (see question 4) that we measured,

using our digital matcher with a regulated power supply. You can use this number when ordering so that you won't have to re-bias your amp (more about bias later).

7. Which of your power tubes have the Perfect Pair matching number?
We provide Perfect Pair matching on the most common audio power tubes: EL34 types, 6L6 types, 6V6 types, 6550 types, KT88 types, and EL84 types.

What is Bias?

Now you want to install the new "matched" tubes you've purchased. Not so fast! In amps that have a fixed bias (e.g., most black and silver face Fenders, Marshall 50 watts or higher, Mesa/ Boogies, etc.), make sure to adjust the bias accordingly. If the bias is not adjusted properly, a few things can happen:

a.. It works fine: You were lucky enough to purchase tubes close to the existing ones (possible but very unlikely).

b.. Crossover distortion, bad tone and low output: The tubes are over biased, low current draw, and run very "cold".

c.. Short tube life: The tubes are under biased, draw too much current, run very hot (indicated by tube plates that glow bright red). This can damage the tubes and ultimately the amp itself.
Tubes can be biased within a certain range. Within this range the response of an amp can be adjusted. For example, say you have a pair of 6L6's in a Super Reverb, the safe bias range would be between 25mA and 35mA. At the high end, 35mA, the amp will distort more quickly and respond better than at 25mA, the low end, which will create a cleaner, more sterile tone.

If you're interested in learning how to bias tube amps, there are several good books available (e.g., Tube Talk for Guitarist and Tech, Inside Tube Amps). Of course, a professional repair shop can also ensure the bias is adjusted appropriately.

8178. Where Do Tubes Come From?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-07 18:54:53 UTC
From: N3DOK
Topic: 8178 Message: 8178

Hi, Back in the 1960s I meet a sales rep for RCA. The tub and parts division. I explained to me that tube companies made tubes for each other. An example would be RCA made 12AX7 this week. The same week another tube manufacture made a run of 12AU6. Button line, they made and sold tubes for each other.

Here is a few words about where do tubes from?

Bob N3DOK

Where Do Tubes Come From?

One of the biggest misconceptions people have about tubes is where they're manufactured. Currently there are no tubes made in the U.S.; production stopped sometime in the 1980's. China, Russia and Yugoslavia are the only countries where tubes are manufactured today.

The marketing of some American companies however leads you to believe that they not only match (see below) and package the tubes, but also manufacture them. Groove Tubes, one of the biggest offenders, purchases tubes in bulk from companies such as Svetlana, Sovtek (Russian companies), sells them under the GT label and then claims their sound is better than others and they charge twice as much. While GT does test and match the tubes, there are other American companies such as Ruby who don't claim to manufacture their tubes and charge more reasonable prices. All right, enough of the self-righteous stuff, let's talk about tubes.

I'm far from a vacuum tube expert but, reading your explanation it sounds like they are talking about tubes running push-pull. The finals in the Kenwoods are in parallel. I don't think that these problems (particularly distortion problems) really apply. Been using unmatched finals in my 530s and FT-901D for years with no difficulty.

Maybe the military gets a general cert paper (just basically stating they're matched), but I've never received any papers listing their electrical properties, nor for matched sets I bought for my Fender and Marshall guitar amps I used to play through. Besides, it would add to the cost of the tubes.

From: Peter A Markavage
Topic: 8177 Message: 8181

Actually I know how to match tubes, but that wasn't the question. As it relates to 6146's, and not audio tubes, or audiophool type web sites who seem to be in a world of their own (see my other post on oxygen free wire, $200 AC cords, etc.), when you buy a "matched" set of 6146's, do you really know how the vendor matches them other than picking two from the same manufactured lot. Obviously, you pay more for a "matched" set. Are you really getting what you paid for? And, as was already posted, audio amplifiers output tubes are generally run in push-pull and not parallel, so the push-pull ideas don't work here.

Ellen - AF9J said in a previous post -"It's just that a matched set is easier to neutralize. In some cases, if the tubes are too mismatched, they will not neutralize out properly, because the neutralizing capacitor will not have enough range to do so."

Tubes manufactured by a specific manufacturer generally conform to a strict set of manufacturer and electrical parameters. Transconductance and Mu-Factor ratings for any manufactured lot doesn't vary by more 2 to 3%. Interelectrode capacitances, between the various elements, is even more a constant with variation of value generally less than 1%. 6146's you buy today, or those you bought 20 years ago, where not matched by the manufacturer and then sold to the vendor as a "matched" set. The supposed "matching" is done at the vendor. As was indicated in the text below, this audio tube seller does his audio tube matching on a 55 year old tube tester.

In the case of 6146's which are run in parallel, and assuming the tubes you buy are new to start with, and buying like codes from the same manufacturer (pair of 6146B's, pair of 6146W's, or a pair or industrial type 6146's) should not require the extra expense of matching nor should there be an issue of neutralization. However, tubes under long stress of use and age can sometimes bring on internal element sag or distortion causing its interelectrode capacitances to change. If you use of these, along with a new tube with the same code, the issue of neutralization can become a problem, since now, the tubes are no longer identical in their electrical and physical characteristics. So, if one tube develops a problem, it's best, if you're a purest, to change both of them. Also, as both tubes age, gain drops off along with the element sag and distortion, which could also hinder continued proper neutralization. Likewise some would also say, it's best not to mix manufacturers, even if the tubes have the same code, since manufacturing processes and internal tube structures might be different even if their tube specifications are identical. I have never seen this to be the case with the 6146 family.

Now with the sweep-tube family of tubes, that's a different story. TS-511 and TS-900 used those.

you receive a set of tubes if you are lucky you might get an invoice //that says they are matched and if you ask you will pay for the privilege
with no certificate assume they are not a matched set if they are a matched set from factory there will be a serial number and a signature of the person who tested them there again you will pay heavily for the privilege buy a set from over the counter asking for a matched set in the old days the retailer would turn around and pick 2 of the shelf of a couple of dozen packets and place them on the counter and he would give you some lame excuse that batch were matched
no certificate with all the parameters they are definitely not matched (((aircraft industry every nut and bolt is certificate and logged in a computer)))
and signed out by the engineer

Topic: 8176 Message: 8184

The matched pair that RF parts offers is one of the last production runs by GE. These are labeled Phillips 6146W. They have heavier construction than some of the other brands. These are actually 6146 B's. If I were replacing tubes in my rig I would pay the extra $20.00 and order these. But my TS-820 still has the original S-2001s and gets 110 to 120 watts CW on 40 meters and over 95 on 28.700.

The tubes in these rigs are not operated in push-pull so crossover distortion is not an issue. However, if they are badly mismatched, one tube will do most of the work and the bias on one of the tubes will not create a very linear condition.

However, the above being said, if I had two 6146 tubes that were good, I would try then and if I was getting 90 watts or better on 28.5 and 100 watts or better on 7.250, I probably would use them.

Conclusion:

Matched tubes are not as important in parallel circuits as they are in push-pull circuits. But the closer that they are matched, the better quality signal you will have along with tube life. But the difference may not be that much.

8186. Question about the TS-830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-09 17:50:51 UTC
From: N3DOK
Topic: 8186 Message: 8186

Hi,
I have a TS-830S. Upon opening up the radio, I have a few questions. This group has been very helpful to me in learning more about the TS series of Kenwood radios. Thanks to all for your input.

In the RF final section there is a Final Choke # L33-0635-05. Reference number L32. At the bottom connection of the choke is light blue capacitor. The other end of the capacitor goes to ground. The top of it is cracked. A number KC103P is printed on it. I have looked over the TS-830S parts list and diagram. Can any one tell me a replacement for this. Or is there a better type to use.
I believe the value is 10,000 pF with +/- 100% tolerance.

Upon looking at the 12BY7A, there is a piece of metal that goes from the base of the tube up along side the tube. Should this metal be put under the tube shield on the 12BY7A? Thus grounding the shield.

Thank You, Bob Ferrey Jr. N3DOK

8187. TS520SE & TS530S Needing a Home

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-09 18:10:19 UTC
From: Graham
Topic: 8187 Message: 8187

Greetings.

Probably only of interest to UK Members, but I have a 520SE and a 530S looking for a new home.

The 520 is NOT the prettiest example on earth - but a worker, and develops 100W on all bands.
The 530 is quite clean, but is down on output on 15 & 10 [spare bottles included]

Located in Lancashire, I would prefer collection/meet.

Anyway if anyone wants to discuss these, please contact me offlist.

Thanks and 73

Graham M5AAV

8188. Re: [TS-520_820_530_830] Question about the TS-830S

Hi Bob,

You can remove the shield entirely from the driver and it will run a lot cooler, if you want, with no deleterious effects.

On the filter cap, that is a decoupling cap of 0.01uF value, disc ceramic, 2KV rating. You could get away with 1Kv but that is pushing it.

73,

Bill K0ZL

Good Morning Bob,
the Metal Strip goes under the shield and wedges between the Glass
and the Shield.
I am looking at my schematic of the TS-830s and I do NOT see a Choke
labeled as L-32 in the Final section.

Gordon

Reference number L32. At the bottom connection of the choke is light
blue capacitor. The other end of the capacitor goes to ground. The
top of it is cracked. A number KC103P is printed on it. I have looked
over the TS-830S parts list and diagram. Can any one tell me a
replacement for this. Or is there a better type to use.

Bob,
That capacitor is Actually C8 in on the Schematic.
.01UF @ 2KV Ceramic.

From: Gordon
Topic: 8191 Message: 8191

Well, I decided to finally put my TS-820 Repair #2 on the Air last evening on SSB. I tuned it up to 100 watts with it's brand new Finals and looked across the band. My first contact was with W1AW/4 in Tenn on 15 meters, but 15 seemed a bit above the MUF so I dropped to 20 meters and retuned. I immediately found W1AW/4 again, so I worked him, then I started tuning up the band.
I worked Serbia, Ukraine, Estonia, Bulgaria, Canada, European Russia, The Slovak Republic, Poland, Germany (2 times), England, then I swung the beam to the North west and worked Hawaii, Marshall Islands, Japan (4 times) and China. So, Looks like this little TS-820 is working pretty good. Time to sell it and buy another rig to repair and restore. Anyone Interested? contact me OFF list please.

8193. TS-520 dead on LSB??

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-10 15:56:09 UTC
From: mmorris43
Topic: 8193 Message: 8193

Hello All,

I just acquired a TS-520 that is in working condition except
that the LSB receive is dead. I'm in the process of obtaining the operators
manual with the schematic. Anyone on the list seen this problem
before? My first thought is a bad mode switch, I have to think
the USB and LSB share a considerable amount of circuitry.

Thanks for your time,

Mike Morris

8194. Bringing a TS-520S back

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-10 12:56:35 UTC
From: Jason White
Topic: 8192 Message: 8194

I was able to survey the condition of a TS-520S I've been given in the hopes I could use it as my first HF rig. I was wondering if someone could suggest the best place to start in diagnosing this radio (Or letting me know if I'd be in over my head!)

I connected the radio to my MFJ tuner with a 50 ohm dummy load and a my 40m dipole to switch to for checking reception. The radio powered up and when I turned the RF gain and AF gain up I was treated to white noise from the speaker.. this seems to be about all that the radio can do. I tuned around each band in each mode and heard nothing but white noise. Switching between CW and SSB caused a noticeable change in the audio that sounded normal for SSB, but I couldn't find any signals. Switching to the 25kHz crystal I heard nothing as I tuned around. selecting fixed causes the receiver to go dead. Into the dummy load, the key causes the relays to flip, but there is no measured output, and no increase in current draw despite where I set the drive knob. On SSB, keying the mike had the same effect with no output despite the input audio, although the VOX appears to be working just fine (so I'm assuming the Mic is also working). I was not able to receive WWV even though I could hear it on my small portable SW radio with the whip antenna. I used the portable as a noise source and tried to see if I could pick up the noise of the oscillator in it, but there was nothing. I double checked that I should be hearing it with my Ten Tec pc radio. Switching to VFO.R had no change. The RF gain setting only made the noise louder or softer, in conjunction with the AF gain (obviously :)) The meter never moved except to swing negative when the transceiver flipped to transmit on all 4 settings.

I'm really a total novice to HF since I haven't had an HF radio since I got my General.. Since the VFO (when set to VFO, not VFO.R) seems to have absolutely no effect, I'm thinking the problem lies there somewhere, or perhaps with the mixer? Tuning around there is just steady white noise.. no TV sweep sounds, static crashes, pops, whistles, birdies, heterodynes.. nothing. There is also absolutely no output from the transmitter section, only the sound of a relay switching and the audio goes dead until it flips back to receive. The only other clue I have is that there is no difference in the amount of noise the transceiver makes between having an antenna connected and no antenna. Finally, for some reason, when I would switch from TUN to CW, or to LSB the "Fixed" LED would come on sometimes, regardless of whether fixed was selected or not. The VFO led never lights.

Anything jump out at anyone, or should I sell this thing as parts and try with something else? My main goal is just to get something usable onto the HF bands..I'm not even picky about which band or mode :) I'm a bit nervous at the prospect of fiddling with tubes without much

experience with them. I have very little equipment available to me, essentially just a multimeter and the tuner to check for RF output... so I'm wondering if I could even fix this thing without investing more in equipment than another radio would cost me. The other thing that's somewhat crippling is that I don't have a 2M rig at the moment either so I'm not able to just key up and ask a local ham for advice (my power supply went AWOL when I moved recently). Thanks for listening, and hopefully someone will instill some hope in me.. I'm saving for my wedding so buying a new rig is out of the question..(and also why I haven't replaced my power supply!).. if the Kenwood is dead I'll just have to pack everything away and try the hobby again next year..so I've got my fingers crossed!

Jason:

Before we decide if your 520 is reasonably repairable, we need to find out some more things.

Do you have an operators manual? If not you will need one. If you do not, we can tell you where to download one.

On the back of this rig there some plugs and switches, check for the following.

SG must be ON
Rec. ant switch must be in OFF
Xverter switch must be in OFF

Ext. VFO plug, must have dummy plug installed. This is absolutely necessary. If you have no dummy plug, use a piece of a standard paperclip to connect pins 8 and 9 together. These are the last two pins CCW looking at the plug from the rear of the radio.

On the front, Function switch must be in either the VFO (straight up) or 25 kHz position. There will be no operation in the other positions.
Turn RF Gain to maximum.
Turn RF ATT off.
Set band switch to 40 meter band.
You may not hear signals on the dummy load. Try connecting the 40 meter dipole directly to the rig and listen for signals. Also try inserting just the tip of the 40 meter antenna into the antenna connector (SO-239) and observe for receive. Do not attempt to transmit this way.

Set band switch to 40 meters.
Now, connect the rig to the dummy load. Place mode switch in tune. Be sure that the carrier control behind the mike gain is fully up (Clockwise).
Place the meter switch in ALC position. Key the radio and turn the drive control while observing the meter for ALC indication. If it does not show any indication try the same thing on CW. Be sure that nothing is plugged in the CW key jack on the rear of the radio.

If nothing is accomplished with the above, unplug the rig and dissemble the top and bottom covers. Observe closely inside for anything obviously burnt, disconnected, or abnormal looking. Let us know what you see.

Also give us some history of this rig or where did it come from. e-bay? What kind of cosmetic condition is it in ? What test equipment do you have ? Do at least have a simple VOM ? (volt ohm meter)

These rigs are among the easiest to work on. It is quite likely that with the help of some of us that you can fix it and learn in the process.

Fortunately, I've got a copy of both the owner's manual and the service manual, but the troubleshooting flowchart in the service manual isn't very explicit. for my situation, it suggests bad transitors.. but it could be because of two things you mentioned:
> On the back of this rig there some plugs and switches, check for the following.
>
> SG must be ON
> Rec. ant switch must be in OFF
> Xverter switch must be in OFF
>
>
I'm fairly certain SG was off. I will follow all your steps and report back what I find when I get home from work

> Ext. VFO plug, must have dummy plug installed.
I think the plug is there.. I used to have a TS-700A (also given to me in a pinch) which had a plug like that, so I know what to look for, but I have to admit I didn't double check, so I'll post what I find when I check all the other steps..

(some parts snipped for brevity)
> Also give us some history of this rig or where did it come from. e-bay? What kind of cosmetic condition is it in ? What test equipment do you have ? Do at least have a simple VOM ? (volt ohm meter)
>
The radio was kept in a garage for about 10 years. When I got my General about a year ago, my father in Florida put out an APB among his friends and the rig was brought out, tuned up, aligned, and passed down to me via a chain of about 4 people here in New England. About the same time I had to move quickly because of a work opportunity, and I ferreted the rig away for a bit until I could get settled and put up an antenna.. I tried to keep it well protected, but a well intentioned but uninformed older sister thought she was doing me a favor, and the radio ended up in a damp basement. To add insult to that injury, she "thinks" it "might" have been knocked around a bit. (ouch!) She thought it was an old stereo. Recently I have managed to get myself in a nice stable spot

where I could put up an antenna, so I retrieved the radio from "storage", set it up, and hesitated for a long time to power it up fearing that I might blow a capacitor or something due to the sub-optimal storage.. Eventually I couldn't take waiting for a variac anymore (and also because the people giving me advice were split 50/50 whether it was wise to use one in the first place), so I just plugged it in and... nothing happened. So, I tracked down a manual, fiddled and twiddled a bit, followed what I could, and I ended up in my present state of white noise, but not much else.. However, this could be because of some of the things you mentioned for me to check, so I'm holding out hope that it's just one of those things.

Physically, the radio looks old, and used, but nothing is missing or broken that can be seen or felt. The worst that could be said is that the handle has a loose thread as far as appearance. When it first came to me it had a light layer of "smokers grime" on the case that I carefully cleaned, but I was told the contacts had been cleaned before I took possession of it. It was quite dusty from it's recent stay in that basement. I opened the case to make sure nothing seemed loose or broken, but other than that I haven't done anything in there. No burnt areas that I noticed.

As for equipment, I have a fairly decent VOM, and that's about it. I've also got someone who has offered to let me use a frequency counter if it will be of assistance in tuning the rig once it's working, but I need to get to that part first.

> These rigs are among the easiest to work on. It is quite likely that with the help of some of us that you can fix it and learn in the process.
>
> Vy 73, Walt N9WB
>

Well that's encouraging, and I'm always up for learning! Thanks for the diagnostic steps, I'll check everything out and post a report tonight and hopefully the radio's condition will be more apparent. I suppose the best thing I have going for me is that I know it was working around a year ago... It's just bothersome because I'm normally quite retentive about preserving my equipment.

73,
Jason

From: kitsune878
Topic: 8198 Message: 8198

Well, here are the results of checking the various things you mentioned Walt.

The SG was set to off, and the dummy plug was long gone. I jumpered the plug socket and switched on the SG, and powered up the rig.

This time I got a VFO light, and it appears the VFO is functioning, but still little to no sensitivity. I couldn't hear anything I could hear on my portable radio. With the switch set to WWV I could just make out a broadcast station in there somewhere, but the audio was so terrible that I couldn't figure out what it was or what frequency. In fact, the radio only seems to receive anything when it's on WWV... but never WWV.

Set to TUN on 40 meters into a dummy load, I was just able to see the needle budge, but not really move. The meter read something less than a half of a watt output when I tweaked the drive for maximum output. This time, however, with the meter set to HV it deflected completely.

Also, I can hear the 25 Khz tone every 25Khz now when the function knob is set appropriately.

I looked inside the case and I can't find anything that looks visually wrong, or out of place.

I hope that gives a better picture of what is going on.. Thanks for lending an ear!

I have a question about a TS-530SP I bought one yesterday from a estate. It looks great and operates wonderful, But it has a International radio inc. 2.1 that is wired in on the af board, It makes the receive a little narrow and some say the transmit audio is a little narrow? clean and clear but narrow. What is the transmit band with of the 530? and does anyone know how to undo this little mod.
Next question what is the differance between the 530S and the 530SP?
Mine is a 40 million serial anyone know if it is early or late?
I have wanted a 530 for years and finally found a really nice one.
Thanks for any help.

8201. RE: [TS-520_820_530_830] TS530SP Filter

From: Richard Harris
Topic: 8200 Message: 8201

The standard filter as fitted to the TS-530S and SP (YK-88S) is 2.4kHz wide -6dB point and 4.4kHz at -60dB. I believe that the INRAD filters have steeper sides than the Kenwood filters.

The main difference between the TS-530S and TS-530SP is that the 'SP has an audio notch filter. To fit this additional facility, the RF and AF gains are on concentric potentiometers - the notch frequency control potentiometer on the 'SP is where the RF gain was on the 'S model . The notch filter on/off button on the 'SP was the calibrator switch on the 'S and so the 'SP uses the round calibrator button near the display.

I am fortunate in having both the 530S and 530SP and both are fine rigs. I hope that you have as much enjoyment from your 530 as I have had from mine.

Subject: [TS-520_820_530_830] TS530SP Filter

I have a question about a TS-530SP I bought one yesterday from a
estate. It looks great and operates wonderful, But it has a
International radio inc. 2.1 that is wired in on the af board, It
makes the receive a little narrow and some say the transmit audio is a
little narrow? clean and clear but narrow. What is the transmit band
with of the 530? and does anyone know how to undo this little mod.
Next question what is the differance between the 530S and the 530SP?
Mine is a 40 million serial anyone know if it is early or late?
I have wanted a 530 for years and finally found a really nice one.
Thanks for any help.

Thanks richard
I am having alot of fun so far. I do want to go back to the orginal filter alone though, The inrad does help under a crowded band though but it is a bit narrow usually.
Thanks

Richard Harris <rjharris@...> wrote:
The standard filter as fitted to the TS-530S and SP (YK-88S) is 2.4kHz wide -6dB point and 4.4kHz at -60dB. I believe that the INRAD filters have steeper sides than the Kenwood filters.

The main difference between the TS-530S and TS-530SP is that the 'SP has an audio notch filter. To fit this additional facility, the RF and AF gains are on concentric potentiometers - the notch frequency control potentiometer on the 'SP is where the RF gain was on the 'S model . The notch filter on/off button on the 'SP was the calibrator switch on the 'S and so the 'SP uses the round calibrator button near the display.

Perry:

Inrad filters are great, but you have observed what I have. A narrow filter degrades SSB too much. Narrow filters are not a good way to eliminate interference because it makes the receive audio sound like you have cotton in your ears. The trick is to have a wide flat top and then cut off rapidly at the skirts.

You probably have the model 94. If you had the model 88, I think that you would be very pleased. The 88 is 2.8 kHz bandwidth between 6 dB points and bandwidth of 4.375 kHz between 60 dB points. The top between the 3 dB points is very flat will less rippling. So what you get is wider usable bandwidth and a sharper cutoff beyond that point for good rejection. I have one for my TS-820 and it was an excellent investment. The receive audio is much more pleasing to me.

Hello Walt
I have the 88H whitch says it it is 2.1 but, If I use the I.F. shift and shift it over about a 1/4 of the way it does sound OK, I have discovered this after a few days of playing with the radio. So far I love this radio, I have wanted to play with one for ever, It also had not been opened up for 17 and 12 meters, and I have done that and put it to use on 17 meters. I have had a couple of 830's but I just like the looks of the 530 and so far am very happy with it, the receiver I think is as good as 830's I have had. Thanks guys for the replys.

8206. Kenwood TS-530SP

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-11 22:21:47 UTC
From: N3DOK
Topic: 8206 Message: 8206

http://www.universal-radio.com/catalog/hamhf/ts530sp.html

The Kenwood TS-530SP is similar to the TS-530S. It is designed for SSB and CW modes in the 160 through 10 meter ham bands, and includes the 30, 17 and 12 meter WARC bands. Power output is 220W PEP SSB and 180W DC CW. The finals are a pair of 6146B or S2001A tubes. One key enhancement over the TS-530S is a Notch filter. (This transceiver does not have general coverage receive).

Requires 120 VAC 50/60 Hz 295 W. 13.3 x 5.3 x 13.37 inches 28.2 lbs (333x133x333mm 12.8 kg).

Features
a.. 160-10 meters
b.. WARC Bands
c.. VOX
d.. NB
e.. 25 kHz Marker
f.. Notch Filter
a.. RIT/XIT
b.. Speech Processor
c.. IF Shift
d.. RF Attenuator
e.. 120 VAC Operation

Topic: 8207 Message: 8207

Hi Group,
My newest project is a TS-830S that was a Dead player when I received it. No receive and No transmit, but it did have "White Noise Audio". I was able to trace the lack of signal to a bad Q5 on the RF board, which after changing, allowed the RF Amp to work. However, The signals are VERY weak. I continued my diagnostics and found a Burnt ressitor on the rectifier board for the 210A circuit, caused by a pinched wire under the RF board. Ok, Fixed that. Now the rig Transmits and receives, but signals are VERY weak. I did an alignment of the Ant and the Mix coils today. What I found is, The Mix Coils seem to do NOTHING at all. The ANT coils do show some sound change when I adjust them using the calibrator as a source.
The only band that shows ANY S meter movement at all when doing the Alignment is 15 meters. I am looking for Ideas???? I looked at the schematic and it appears if L41 (1.5 MHZ Coil) is Open, it would effect Everything in the MIX Coils... Ideas anyone ?? I have NOT removed the coil yet to Ohm it.

Gordon

8208. Re: [TS-520_820_530_830] My Newest Project.

The first thing to do to the Kenwoods is clean the relays ...mostly the antenna relay enclosed in the little metal box near the rf cage. More often than not this alone will bring back normal reception levels. Use business card paper cut up in strips and soaked in contact cleaner and pass the strip many times along the contacts. After pass a dry strip to burnish (a bit) the contacts. I repeat this operation two or three times. I brought a perfectly good but deaf TS 820 back to life this way. Never use abrasive paper or (fine) files...all you will succeed in doing is take away the very fine silver or gold coating on the relay contacts and it will fail completely in a few weeks.

L41 is open.

They are no longer available.

Anyone up to the challenge of making a replacement for these?

Thanks Bill.,
I figured as much. Anyone have an L41 that they are willing to sell?
Are these Coils Repairable ? Can they be rewound ? Can they be
replaced with something different ?

Ok, I pulled the Coil and Ohmed it. It is NOT open, It is Shorted
out. All 4 wire terminals have continuity with each other and it
smells Burnt.
Boy, That's some small wire to try and rewind..hi hi..
I'm hoping someone has one they will sell me.

Gordon,

I had a similar problem with my TS-820. L8 on the coil pack was burned shorted. It had the same symptoms, all four leads were shorted. It is in the RX antenna path therefore it caused the sensitivity to be very low.

I was able to unwind the coil very carefully counting the turns and rewind using wire from a coil on a stripped Hallicrafters S-40 chassis.

Might be worth a try if you cannot find a replacement.

Good Luck,
Dave

Gordon:

I understand that failure of L 41 is very common, although it is interesting that L1, L2, and L5 don't also get wiped. You may want to check the connections where the coil was to see if there is any voltage there that should not be. We are assuming that a surge such as lightning came in from the antenna.

I have not been inside an 830 for years. Is this a slug tuned coil, Is it covered by a can? From the diagram, it has a low impedance input and a higher impedance secondary and is an RF transformer.

I wonder if it would be possible to use a transformer that feeds the first mixer in some kind of AM radio receiver? I see that it shows a 1.5 m below it and 1.5 MHz will fall in the AM band.

Just thinking, which usually gets me into much trouble.

Topic: 8218 Message: 8218

Hello to all,

After restoring two 830, I now have purchased a ts-130s. The problem here is that there is no rx and no display on 12m. All the other bands are ok. The warc modification is done. Any idea where to start looking ? Another problem is that there is a lot of "free play" on the bandswitch.

All suggestions are welcome
Thanks
73
Frank

Hi Walt,
I also wondered about L1 and L2. I didn't worry about L5 as it is the 3.5 M coil and isn't part of the Antenna Input. I also was suspicious of High Voltages, But so far, everything appears normal. Perhaps the Lightning Idea is the root cause.
Yes It is a slug tuned Coil covered by a Can. I also thought of trying to use one from an old AM radio if I could not find the original.I unwound the coil last night and found the the Insulation coating on the wires was gone and it was shorted , I carfully rewound it and put it back into the rig, then I actually was getting good response when doing the alignment, however, I inadvertanly used a metal tip tool to adjust L41 and BROKE the Slug, then broke the coil while trying to get the broken slug out. (Talk about going from bad to worse)
I had a fellow contact me who has the Coil and the connectors I needed. I purchased them and he is shipping them today.
I searched the Net and found that Burghardt actually has that Exact Part number,(L34-2004-05) but they just list it as input transformer. I tried to call them to ask if it was a slug tuned transformer/coil but the line was busy for over an hour when I tried.
So what Did I learn, "NEVER USE A METAL TIPPED TOOL" when Adjusting Slugs ! Luckily for me, someone came forward with the parts I need.
73,
Gordon

Topic: 8218 Message: 8220

Frank,
The FIRST thing I would do would be to Locate the cause of the excessive play in the band switch. I then would clean the contacts on the bandswitch with de-oxit. Also, I used to have a TS-130S and there were some issues with the board screws not being tight enough and therefore causing bad grounds. I will try to find some of the articles I used to have for the 130.
For now, Take a good look at that band switch

73,
Gordon

8221. Ebay TS520S item 9740908208

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-13 18:51:42 UTC
From: stevehurstg8lik2003
Topic: 8221 Message: 8221

Bought this as was described as VGC and from someone with over 200 positive feedbacks (no negatives). However it was obvious the rig had been dropped on its back at some time before transit, top RH corner of the cover plate was crushed inwards and the rear chassis had a deformation where it had been bent after presumably landing on something hard on the 12VDC heatsink.
Certainly would decribe it as 'fair' not very good in view of marks, failing RHS leather carry handle. Also apparent that 28MHZ bands had been changed to CB,well I can live without that for £125 plus shipping of £23.And don't want to predudice my 100% feedback status hi!
Interesting fault-the stock microphone (not suppled) would not engage transmit though by selecting 'SEND' all OK. Internal examination showed a broken earth wire to the microphone socket from the chassis-cured with a dab of solder.
Anyway about the 4th contact was 3X2 (Republic of Guinea, West Africa) so seems a better buy now :) In any case you have to take the rough...with the smooth
Moral-can't always expect great things even from Ebayers with great scores....let the buyer beware.
Best 73's to all and its a great forum, have learnt a lot!

Cheers, Steve G8LIK

8222. help with possible receive fault

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-13 19:13:27 UTC
From: nigel4416
Topic: 8222 Message: 8222

Dear All
I have just bought a TS-820 at a rally. It was sold as "receiver working" but transmitter "not tried". I installed it into my shack and left it on receive with the "heater" on for 7 hours. When I tried the rig the transmitter works like a dream with 5/8 and 5/9 reports with a good audio and a healthy 100w out.
The problem I have with it exists on receive. When the rig is switched on from cold and the antenna connected to a dummy load I would expect the meter to read just above the zero mark. But instead it reads a quarter scale. As the unit warms up (10 minutes or so) the meter slowly moves downwards towards zero finishing up at about 1/8 scale (during this time the receiver sensitivity and audio noise level raises slightly). In addition if the RF GAIN control is turned fully anticlockwise so that the meter swings to full scale deflection and then quickly turned fully clockwise the meter drops straight away to zero but then creeps up to 1/8 scale (within a few seconds) with a reduction in receive sensitivity and noise level. I am not sure if this is a fault or if it is suppose to do this, can anyone please let me know? (the ALC switch when switched between slow, fast and off has no effect on the fault).If it is a fault can anyone please point me in the right direction to fault finding it.

Nigel, my first ebay TS520SE exhibited somewhat similar symptoms-the S meter was reading around a third scale on all bands with no input. All it seems to have been is the RX signal level metering. Without searching for the handbook-on the very left rig under the top cover is a board with a couple of pots you may need to adjust. One is 'meter zero' and the other is RX signal strength meter sensitivity. Quite why mine were out I don't know but if yours is the same its dead easy to adjust.
Apologies I can't give you the pot numbers but these are in the handbooks.

Yes, that's correct Steve. Anything you buy on eBay, you better be prepared to fix it - even if it is coming from another ham. Often they aren't even aware that something is wrong because they don't use all the features, bands, etc. Keep having fun with the 520.

Topic: 8225 Message: 8225

G'day all

I have a TS820S that I am restoring.

I have had great help with parts from a great fellow here in Australia, which has been wonderful.

I have two problems that I can see:

1) The receive is low, close by signals are heard but it seems that the receiver is about 40 db down, any ideas where to look or what may be the problem?

2) The Speech processor does not work, when you pull the processor on the power output drops to almost zero. This sounds like a fairly easy fix but I just need an idea of where to look.

I really appreciate the help guys.

And to those who helped with the 520, thanks, it is now working 100% correctly. Thanks again guys !!!!

We are so lucky to have a great bunch of minds on this group to ask advice from.

G'day Steve

I recently got a TS 820S here from a VK ham website.

The radio arrived with substantial damage and obviously had been dropped in Transit, even though the packaging was intact.

The moral to the story is that with the weight of these old radios (nearly 40 punds), they suffer substantial damage to the chassis/ external controls if they are dropped, even though they usually still function ok. So maybe it was dropped after being packed but the packaging simply does not exhibit overt signs of any damage?

Just a thought mate.

Anyway, enjoy the radio !!

Anthony,
For the receive problem, be sure that L8 on the coil board is not Shorted or open. Also, Be sure to check the connectors where the wires hook to the Coil board. Both 820's I have restored have had many BAD connections. Seems to be a common problem. Some of the connectors actually had bad terminals inside the connector , that were actually broken.
I'm not sure on the speech processor. Walt, N9WB is pretty good on those though.

73,
Gordon

8228. Interesting ts520 audio fault

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-14 00:10:44 UTC
From: vk3bfa
Topic: 8228 Message: 8228

This one drove me mad for a few days....

Symptoms. Lousy audio quality, very harsh. CRO showed very short high amplitude spikes on signal.

Remedy: - tighten bolts holding down audio out transistors - had gone high resitance due age. Bolt heads are soldered to PCB, relying on presssure of nuts to make conatct with metal can.

Usual fault finding methodology didnt work in this case, ie disconnect input, noise dissapears. QED - noise SHOULD be external to amp. (Wrong in this case - red herring) Progressively disconnect signal chain, noise level reduces but still there.

Finally, took output of detector and fed to external audio amp - all ok. This isolates fault to audio board, and then was found ......

Date: 2006-07-14 10:28:02 UTC
From: Walt Breining
Topic: 8222 Message: 8230

I have run into this with TS-820s that were in a slightly damp environment. If you wait for a while and turn it on often, the problem will go away. I have run into this with 3 820s and have never been able to resolve the problem other than moving them to a very dry environment. The 820 I currently use did this for 3 years in a less than perfect environment. I moved it to our county emergency management office. After about 2 weeks it quit doing this and has not done it again in 3 years.

If anybody figures this one out (Hay Bill K0ZL!) I am anxious to know.

G'day mate

Sounds like a strange problem,

Have a listen to this one:

TS820S.

First issue: receive is fine on LSB and FSK, until you transmit, then the signal drops by about 40 db. Turn the radio power off, and the display comes on 100 plus kc higher than what you were transmitting on and the radio is still deaf, flick the band switch and the receive jumps into life and the frequency display is correct !!!

As soon as you key up, it goes deaf again and you have to repeat the process.

Second issue. On every other mode than LSB and FSK, the vfo does not change the display frequency and on 10 meters display is 290000 mhz, same on 21 mhz (290000), on the other bands same thing 7 mhz show 90000, as does three megs and.

Very, very strange don't you think

And I am trying to fix this thing, I only just bought it as a restore/parts job !

&3's
Anthony

Steve,

I don't know who shipped your radio, but I would not be too quick to assume the radio was damaged before transit. Shippers just don't treat these old radios very well. Several years ago, I bought a pair of Kenwood twins (R & T 599D)at a hamfest from a reputable dealer. When I got them home, there was a minor problem with the transmit on one of the upper bands. I emailed the dealer, and he said to ship it back to him. I packed it well, and double boxed it.

I shipped it back via UPS and he emailed me a couple of days later to say the radio was fixed and being returned via UPS. It was also double boxed on return. When I got it back, the transmitter did not sit level, and on closer examination, I saw that the fan housing had been pushed part way into the back of the radio. Needless to say, nothing worked.

The good news was that the radio was insured by the dealer, and after UPS telling him that it had not been packed properly, etc., they finally paid up. I have seen that dealer several times since, and we both refer to that one as the radio from hell.

More good news was that I took the money from the refund and bought my TS 520 from a ham on QRP-L who lived a couple of hundred miles away. He did not ship it... we met halfway to close the deal. :)

Anthony,
Sure sounds like you have a BAND SWITCH problem. Might even be
inside the Final cage, But I will BET it is a Bandswitch problem
Only other thing that possibly comes to mind is some bad grounding,
but that is easily fixed by backing all the Board screws off half a
turn and then retightening them.
Clean the COMPLETE bandswitch and retighten the ground/mounting Screws
and let us know how it turns out.

Anthony,
WAIT. I just remembered a similar Problem. Turned out it was the
BAD terminals inside the Connectors that went to the RELAY board. The
terminals inside the Connector had lost their "SPRING" and were
Broken. Don't know HOW I forgot that, as I pulled my Hair out tryinmg
to find it..

G'day Gordon

Thanks mate

I will check that out.

I also think the radio may have a power supply problem as well, but I will check it all out when I get some time.

Thanks again mate.

Regards
Anthony

Anthony
Charles here
if its like Gordon says those rotten terminal connectors I have some
only 3000 miles away in the west w.a. that's if you still have my e-mail
they do loose contact what I usually do is remove the terminal connector
from the block ((TRICKY)) and re set the tension (providing I have red
Gordon fix correctly)

Hi Anthony,
May I ask why you think you may have a Power Supply problem?
I might add that "EVERY" TS-820 I have worked on, needed the Diodes
resoldered on the Rectifier Board.. May be worth a Look on your as well !
G'Day Mate !

Topic: 8228 Message: 8241

Hi Charles,
Yes you read it correctly except for the fact that sometimes, the terminals are BROKEN, thus nothing left to reset the tension on. I found about 8 broken on one rig alone. The clue was, if I wiggled the wire while the rig was on, I could get things to change on receive.. So I took the connectors apart (as you say, TRICKY) and found they came out in 2 pieces... Had to Replace the terminals.. Luckily, they are easy to come by here in the States.

hallo Gordon
Charles returning
you are right there difficult to get here I broke one 820 down to get
spares personally I think it is a human problem (pushing and pulling
these connectors they were only made to go together once at the factory
and all old ladies like these wonderful radios need tender loving care all
our bones get brittle ....thin brass does get brittle with age develops
stress cracks and they are minute so please gentle men treat them
gently when pulling and tugging and re connecting
Charles and rusty

8244. Re: [TS-520_820_530_830] using a transverter with a ts-830

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-15 05:08:46 UTC
From: Bill Leahy
Topic: 8233 Message: 8244

Your primary concern is to keep the rig from blowing the transverter!

I set up an 830 for a guy, using the SG switch; instead of turning the finals clear off, I found a voltage value that would let the rig transmit at 5-8 watts, just perfect for the TenTec transverter.

G'day Gordon

Mate, I resoldered one of the large capacitors last night as it was arching !

The reason that I think the Power supply is a problem is that the power output is quite low, about 5 or 10 watts on ssb and when listening through another radio I can hear "warble" on the kenwood audio (frequency wobble).

Maybe it is another issue, but otherwise it is a nice clean old 820S, the digital readout is perfect (believe it or not).

Just the thing to keep me occupied !!

Thanks again mate for the help.

Hi Anthony,
May I ask why you think you may have a Power Supply problem?
I might add that "EVERY" TS-820 I have worked on, needed the Diodes
resoldered on the Rectifier Board.. May be worth a Look on your as well !
G'Day Mate !

Anthony:
After you check out everything else, carefully remove the VCO board and the PD board. Use a magnifying glass and look over the solder connections on the bottom of these boards. Be very thorough. Some solder connections may look cracked around the component leads. Be sure to check where the connection pins solder to these boards. CAREFULLY re-solder any bad looking connections.

Do not attempt this unless you are good at soldering. Use a low watt iron and good solder. Guard against solder bridges as these can cause permanent damage if the board is activated with a solder bridge.

Clean the test switch and all connection pins with De-oxit.

I recommend that you mess with these boards only after you have considered all other possibilities.

Anthony,
WAIT. I just remembered a similar Problem. Turned out it was the
BAD terminals inside the Connectors that went to the RELAY board. The
terminals inside the Connector had lost their "SPRING" and were
Broken. Don't know HOW I forgot that, as I pulled my Hair out tryinmg
to find it..

Anthony:
Forgot to mention earlier, VR 4 on the AF AVR board goes bad causing the 9v supply to have problems. Look at the 9v with a volt meter and gently tap VR 4 with an insulated tool. If it acts intermittent replace it.

From: Bill Leahy
Topic: 8248 Message: 8249

Which caps? If the high voltage caps, should have nothing to do with the readout voltages. However, something else may have been disturbed in the process.

You may want to pull the rectifier unit board and check all solder joints, particularly around the low voltage PS diodes.

Your primary concern is to keep the rig from blowing the transverter!

I set up an 830 for a guy, using the SG switch; instead of turning the
finals clear off, I found a voltage value that would let the rig transmit at
5-8 watts, just perfect for the TenTec transverter.

Anthony:
Forgot to mention earlier, VR 4 on the AF AVR board goes bad causing the 9v supply to have problems. Look at the 9v with a volt meter and gently tap VR 4 with an insulated tool. If it acts intermittent replace it.

8253. Tektronix Oscilloscope

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-15 21:21:25 UTC
From: Gordon
Topic: 8253 Message: 8253

I was wondering, I am thinking of buying a used Scope that is NOT going to cost me an arm and a Leg.
I have been looking at some Tektronix Oscilloscopes, But held off until I could get some feedback from some of you guys. I figure a scope could aid me in repairing some of these Rigs.
So, Can I get some Opinions from some of you?

Thanks,
Gordon

8254. Need Help with Kenwood Twins

Hi everybody. I have a chance to buy an old set of 599D Twins that are pretty much basket cases. Will take a lot of work. The interconnecting cable is missing. I know these rigs are not worth much without the cable. Does anyone have a cable you would be willing to part with? If not, do you have any idea where I can come up with that old 16 pin connector needed on each end so that I could possibly build a cable?

Thanks very much and 73,
Mike, WC0L

They're great rigs with or without the interconnecting cable. The cable just turns them into a transceiver. Separate receiver and transmitter setups have been around since the beginning of radio. A cable supplier probably can come up with the cable or check Mouser, Allied, or Newark Electronics. I can't remember, don't have the schematic in front of me, whether there is any shielded wires in the original cable. If not, get two lengths of 8 conductor rotor cable. The same kind of cable used on the CDE/Hy-Gain rotors. I believe there are only 12 connections needed on the connectors. The connectors are available from some Company in England. Check the archives; I believe the source was given once or twice. I've had my original 599D Twins running fine on AM and SSB since the mid 70's.

Hello Mike,
These rigs are worth their weight in gold and you will be pleased that you decided to resurrect them. Firstly, if you cannot find connectors or don't want to fabricate cables, I see them on eBay frequently.
Next, I purchased a set of 599D twins on eBay NEW IN THE BOXES in 2002. They cost me $1K US but they were worth every penny. Having had 520s, 820s, 120s, 530s and much other brand gear; these rigs are about the best I've ever operated with. They are absolute quality, rock-solid and a feature-packed pair.
Best 73 and good luck on your purchase.

Minimum 60 mhz, dual channel, non digital. Does not have to have memory function.

Make sure you get the book and the probes (x10), or can get them easily.

For the most part, Tektronix scopes are great. Take a good look at the intensity on the crt if you buy one of the newer models. Some have a fairly short life on the crt and replacement is expensive. A quick web search will tell you which are the problem models. My experience was with a 1400 series.

Many radio IFs are 70+megs; many Local Oscillators likewise are "up there".

I have a scope that is rated to 15 megs, it does respond well up thru 30
megs; about 3x a year I need something higher.

Hi Mike, On this web site. http://www.rigpix.com/index.shtml
Go to the page on the Kenwood http://www.rigpix.com/kenwood/kenwoodselect.htm
You will find the wiring diagram for the 16 pin connector that goes between a R-599D and a T-599D. If you can find the plug, you may be able to wire your own cable. The last thing wound be to change the connectors on both radios to another type setup. I'm sure there will be some other ideas. Or you may find a real cable!

Good Luck,
Bob N3DOK

Hi,
I searched the archives and found some theoretical discussion on using these pulse rated,electrically ruggedised tubes from the 6146 family. I recently purchased some from eBay as potential spares for my finals. What I should be interested to know-has anyone actually tested 6293s in a Kenwood hybrid and if so any issues such as neutralising?

73's to all

Steve G8LIK

Well, I received the 1.5 Mhz Ant Coil (L41) that I had discovered
was bad. I replaced the Coil and now the Rig works GREAT ! I also
replaced a bad wire loom that the connectors were deteriorated. I
completed the Alignment and adjusted the S meter to scale.
I neutralized the Finals and I am going to put it on the air Tonight
(If I get time).
Sure is a good feeling when you take a dead player and turn it into a
Fine piece of gear.
Now I need to look for another New Project .. This TS-830S Looks
Pretty good and seems to work Very well.
I'm starting to have TOO many Radios on hand though !
Time to sell/Swap a couple...

73,
Gordon

8268. vfo230 problem and question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-18 01:55:42 UTC
From: dalepavlicek
Topic: 8268 Message: 8268

Picked up a vfo-230 ,the unit is locked up as though the pto is shot.
The readout is also not 100%.All the switching functions between the
ts830 and the vfo seem to work ok. I don't have a good enought bench
to be able to service the vfo230,any body have any suggestions where I
can send the vfo for service?
Also I have read that there is a mod for the vfo230 to drop its
tunning rate from 2o+ to 6.6 per revolution. anybody steer me to a
place where I can find out more about this mod. Can it be done also to
the pto on the ts-830 itself
I sure would be greatful for any help on this.
thanks
dale wt4t

hi alex,

the cable pinouts for the TV-506 6M transverter
are in the manual for the TV-502 2M transverter
(strange that kenwood did not include both in each manaul)

cable pinouts for the TV-502 2M transverter
are in the manual for the TS-520 radios.

here is a link for the manual that I uploaded to N6WK

http://www.n6wk.com/kenwood/tv-502.PDF

Dale,
The Small (Idler Gear) is probably frozen on its shaft due to the
grease drying up. When that happens, the PTO appears to be "Locked Up"
I have carefully removed the gear, cleaned it up and relubed the
assembly. when you get done, it works like a fine Swiss Watch !
This is NOT a difficult repair.

Gordon,

Thanks for the feedback. In the meantime I have cleaned all contacts
with contactcleaner and washingspray. No effect. I manipulated the
contacts on the swichboard with a toothpick to see if there was a
false contact, but no effect at all.
I have also tightend all boardscrews. No effect.
Pulled out all the connecters, cleaned them, but no effect !
The cause of excessive play on the bandswitch is a "loose" planetary
drive. But I cannot reach it to tighten it up. I should remove the
frontplate, but I don't know how. I have no technical manual...
Still No rx and no display on 24 mc yet !

Hi Dale,
yes, I found the Mod on the Web.
It is about half way down the page:
http://www.radiomods.co.nz/kenwood/kenwoodts830.html

Ok, On the VFO.. I'll get it right yet.
It appears that the 230 does NOT have gears, so It would mean that
the Encoder shaft is frozen.
It could very well be that something is stuck in one of the slots in
the encoder wheel, or it could be that the shaft is just stuck in it's
bushing. I looked at the pictures just now, and it should be easy to
determine what is wrong and fix.
Sorry about the confusion, I was picturing the VFO inside the 830 when
I started talking about gears !

Take some time to get to know the 830s. You will probably really like it. It has a good processor, something I can't say about a lot of rigs and the receiver is outstanding.

Well, I received the 1.5 Mhz Ant Coil (L41) that I had discovered
was bad. I replaced the Coil and now the Rig works GREAT ! I also
replaced a bad wire loom that the connectors were deteriorated. I
completed the Alignment and adjusted the S meter to scale.
I neutralized the Finals and I am going to put it on the air Tonight
(If I get time).
Sure is a good feeling when you take a dead player and turn it into a
Fine piece of gear.
Now I need to look for another New Project .. This TS-830S Looks
Pretty good and seems to work Very well.
I'm starting to have TOO many Radios on hand though !
Time to sell/Swap a couple...

73,
Gordon

Don't know if it will work with your VFO, but Ronsonol lighter fuel has been used for years to free gummed up camera adjustments. It softens the hardened lubricant and then evaporates.

Hi Dale,
yes, I found the Mod on the Web.
It is about half way down the page:
http://www.radiomods.co.nz/kenwood/kenwoodts830.html

Looks like a fairly simple Mod.
Oh yea, When you remove the dials on the VFo, pay close attention to their alignment.

On the VFO Gears, I just realized that It might have a different gear assembly then I thought. Pull the cover and take a look. If there are gears (I'm fairly sure it does) might just try spraying them with some De-Oxit and let them Soak, then try working the PTO back and forth until it comes free. Once free, you can add a drop of sewing machine Oil to them.

Hi Walt,
Yes, I had and used an 830 for Over a year. In fact I had just sold it a few months ago. I agree, They are Great Rigs. I also agree that the Receivers are Fantastic in these 830's. I'll play with it for a bit, and then Sell it, I use the Sale Money to buy others to repair as I am enjoying repairing these old Rigs. It's a fun Hobby.
I had never realized how much fun and satisfying it is.
I'm having a Great Time doing it.

Ok, On the VFO.. I'll get it right yet.
It appears that the 230 does NOT have gears, so It would mean that the Encoder shaft is frozen.
It could very well be that something is stuck in one of the slots in the encoder wheel, or it could be that the shaft is just stuck in it's bushing. I looked at the pictures just now, and it should be easy to determine what is wrong and fix.
Sorry about the confusion, I was picturing the VFO inside the 830 when I started talking about gears !

73,
Gordon

I just Noticed,
My Latest TS-830S project is actually a TS-830S GOLD version. It
sure does work good. I have been having qso's tonite and it is FUN to
use. Has the Optional CW filter in her also.
So, what is the best way to sell these rigs? Here? Eham ? Ebay ?
Anyone have any suggestions ?? I LOVE repairing them, But I need to
sell them to Purchase more to Fix !! I really don't want to use Ebay
to sell my toys....

So you have a Gold version? These are quite rare. The tank coils of these units were made of a special metal called accelloraium. It caused longer wavelength signals to travel more rapidly that the speed of light which allowed them to propagate more like shorter wavelength signals. These were only marketed for a 60 day period because the WARC committee quickly banned their use because of concerns of time distortion issues. However, you can secretly use one of these on 80 meters for DX. It will be particularly effective on 80 DX because accelloraium resonated signals will propagate like most 20 meter signals.

Just keep a low profile when doing this.

hi alex,

the cable pinouts for the TV-506 6M transverter
are in the manual for the TV-502 2M transverter
(strange that kenwood did not include both in each manaul)

cable pinouts for the TV-502 2M transverter
are in the manual for the TS-520 radios.

here is a link for the manual that I uploaded to N6WK

http://www.n6wk.com/kenwood/tv-502.PDF

Hello to the group, joined today. My last hybrid rig was 5 years ago (Yaesu FT-101ZD). Ive missed it since I sold it. I've been looking for a good deal on a Kenwood TS520-S. I finally found one locally and got a great deal. It puts out about 120 watts on 40Meters and about 95 watts on 10 meters, I think I remember this is about right with 6146b's?? Very stable VFO it seems, better than the Yaesu. Anyway that's the deal with me briefly, cheers, scott.

Hi,
I am needing the plastic face plate and retaining nut for a 530sp.
Does anyone have these parts or can refer me to a place to purchase them?

Thanks,
Larry - N4HIT

8287. Re: [TS-520_820_530_830] Re: vfo230 problem and question... problem solved...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-19 14:18:49 UTC
From: yash@aol.com
Topic: 8268 Message: 8287

Hi Steve and Gordon
Pulled the 230 apart ,checked the pto,the shutter wheel and the sensors all seemed fine. pulled the main board and checked for bad solder joints ,found nothing,cleaned all the contacts and plugs with deoxit and even added star washers under the grounding screws...put it all back together and guess what ... STILL DIDN'T WORK... all the same problems as before. I received a e mail from Don, wb0ain, said to try a reset on the vfo???
I reread the manual and found the paragraph suggesting a reset.must have read the manual and the service manual a bunch of tomes and never picked it up. ....anyway the reset is done this way... turn the rig on with the vfo cabled to the 830,THEN PULL THE LINE CORD PLUG OUT ,the 230's, 120vac line cord, wait about 1-2 minutes and then plug it back in. results.. vf0 230 now works as new!!
One of the neatest things is the 230 has a lower tuning rate than the vfo on the 830 itself.much easier tune on ssb and fantastic on cw with tight filters. Iam going to check out lowering the tuning rate per the mod that we found and see how that works out.
Thankyou all for all the help and suggestions on this project,Its really nice to know we have somewhere to get help on the old kenwoods.
thanks
dale wt4t

Topic: 8268 Message: 8290

Thanks for the Info Dale,
I was NOT aware of the reset possibility on that VFO.
Learned something new today...Cool !

73,
Gordon

Dale, I wouold LOVE to get a Copy of the SERVICE manual for the VFO.
Do you have any way of doing a Copy of it?

73,
Gordon

So you have a Gold version? These are quite rare. The tank coils of these units were made of a special metal called accelloraium. It caused longer wavelength signals to travel more rapidly that the speed of light which allowed them to propagate more like shorter wavelength signals. These were only marketed for a 60 day period because the WARC committee quickly banned their use because of concerns of time distortion issues. However, you can secretly use one of these on 80 meters for DX. It will be particularly effective on 80 DX because accelloraium resonated signals will propagate like most 20 meter signals.

Just keep a low profile when doing this.

I just Noticed,
My Latest TS-830S project is actually a TS-830S GOLD version. It
sure does work good. I have been having qso's tonite and it is FUN to
use. Has the Optional CW filter in her also.
So, what is the best way to sell these rigs? Here? Eham ? Ebay ?
Anyone have any suggestions ?? I LOVE repairing them, But I need to
sell them to Purchase more to Fix !! I really don't want to use Ebay
to sell my toys....

Gordon,

I have positive experiences buying and selling on QTH dot COM. That is where I bought my 830S. Ads are free but I always send Scot a small donation whenever I sell something there. I sometimes use eBay but usually try QTH first.

Welcome to the group Scott, :)

Kenwood hybrids sure are cool. I first used them back in the mid 8u0s in college (the Univ. of WI hamclub had an 830S, and I briefly had a 520S). Nowadays, my Hybrid is a TS-820 (the first year production model of the TS-820S). I love the SSB audio, and the fact that receiver is so quiet.

73,
Ellen - AF9J

Hello to the group, joined today. My last hybrid rig was 5 years
ago (Yaesu FT-101ZD). Ive missed it since I sold it. I've been
looking for a good deal on a Kenwood TS520-S. I finally found one
locally and got a great deal. It puts out about 120 watts on
40Meters and about 95 watts on 10 meters, I think I remember this is
about right with 6146b's?? Very stable VFO it seems, better than the
Yaesu. Anyway that's the deal with me briefly, cheers, scott.

Thanks for the nice welcome. I'm having a lot of fun with the rig even with the poor band conditions on 40 meters this summer. Have received very good audio and signal reports, and I agree Ellen, that the receive has a very low noise floor, unlike my modern Icom rig which is hard to listen to under noisy conditions. Is there a list of serial numbers and production dates. I was trying to find out the year it was built. I've searched here and the web, with no success. Also, my rig is missing the side door control cover, does anyone have an idea where I can get one? I guess that enough questions and general rambling for now. 73's, scott.

No wait it's the dylythium crystals in the final board that make it
a Gold Version ..... For a more detailed explanation try
www.k4eaa.com he has a good explanation on the differences on his
site....de ka2hhb

8301. FIRST POST! Can I Adjust the compression level with a pot on my TS-530S ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-20 14:04:20 UTC
From: wayfound2000
Topic: 8301 Message: 8301

This is my first post The 530 is a superb radio. I have now got an astatic teardrop mic but would like to have just a tad of compression on with it. The amount of compression seems to be fixed. Is there a pot or something to adjust the amount...
all the best folks - Kenwood audio Wins! Many thanks Pete

8302. TS-830 L41

Yahoo group: TS-520_820_530_830 (2006)

From: Larry Shorthill
Topic: 8302 Message: 8302

I've got a real nice, clean (9 out of 10) TS-830 that I've been going over off and on for a year or more. One or more prior owners didn't seem to have a clue about the finals and how to bias them. The cathode resistors were OK, but one of the resistors in the screen circuit was an order of magnitude off -- they must have read the resistor color code wrong. Anyway, the Tx side seems to be working great now, but I can't hear a thing other than the calibrator. I've cleaned the relay contacts a couple of times, just to make sure, and I've fixed the bandswitch and timed it, etc. The only thing that seems to me to be a common thread here that is left is L41, the 1.5 Megahertz antenna coil.

One of the members recently mentioned that Burghardt had this listed and I went and placed an order last week (after verifying on their site that they had current inventory) only to get a message on Monday that they didn't have any in stock and it is (obviously) discontinued from Kenwood. SO now I'm looking for one of these from a list member with a parts rig. Please contact me off list if you happen to have this part available. Not sure I need it 100%, but if I don't I'll make it available back here.

Hello Larry,

do you not have the possibility to use a second transceiver
or a rf generator to check the if stages?

From: George Copeland
Topic: 8306 Message: 8306

I just got a screamin' deal on a TS 830s. This radio looks like brand new, has been sitting in the box on a shelf for 10 or more years. Got the matching tuner in same condition too. I had to wiggle all the connectors to get everything working right. I have only tuned up into a dummy load so far, everything looks good... Except the warc bands. It has never been opened up. I am a little leary about this mod as the instructions in the manual are not quite as clear as I would like,and my sight is not quite what it used to be. If someone can give me this in a bit more detail I would appreciate it.
Thanx & 73

hi jody,

what problem(s) are you having with your ts-520s ?

Not sure of your repair skills (I am no expert either !)
but with the help of the group you may get the radio
back on the air.

Topic: 8306 Message: 8308

Hi George,

I did the WARC band mod to W9YT's (the Univ. of WI ham club) TS830S back in 1987. There are 2 ways to do it:

1. Clip the individual blocking diodes for each WARC band (recommended at the time, because we still didn't have 17m priveleges back in '87). Clipping a blocking diode for a specific WARC band, activates that WARC band.

2. There is one jumper wire that you can cut, that will activate ALL of the WARC bands at the same time.

I did it the second way. It was quick and easy, and frankly, at the time, I didn't feel like digging into the radio to find the diodes. The jumper wire is located on one of the boards, at the top of the radio. Be careful when you do it. where the jumper is located, is pretty crowded with other wires, cables, and components. Your manual should detail both of the mods mentioned above.

as a result of doing the above mod, I had a lot of fun operating on the 12m band in the spring and summer of 1987.

73,
Ellen - AF9J

Kay,

Yes, I have access to lots of stuff that would help me debug this. It's not been a high priority to get it running and I have been working a little at a time on it. I still have connectors to deoxit although I've gone over all the various switches and relays. I'm just anticipating that it's L41 and want to try to get one, or at least locate one in case that's the problem. I will have to do a full up alignment on this to see if that is the problem first, I guess, so my request might be somewhat premature.

Thanks for the response back and..

According to the manual there are 2 wires to cut. If you got it with 1 I would like to know which one. According to the manual one of them is the center of a shielded wire, and that one makes me a little nervous.

Burnout is a real problem in the repair industry; believe me!

I have been blessed with the best customers; over 20 years and about
1600 customers, only a handful have been a problem. Hams are the best!

Topic: 8306 Message: 8316

Hi George. I've been monitoring your comments of concern about modifying your TS-830S to transmit on the WARC bands. I think Ellen made the correct suggestion - just cut the one wire that opens up the transmitter for use on the WARC bands. Don't mess with the diodes because they are hard to get to in comparison.

The name of the signal wire you will cut is "TOF", and it is the wire going to Pin 1 of Connector 6 on the RF Board (X44-1360-00). This is a 3 pin connector, and Pin 1 is located at the corner or the board (actually an offset corner in about the middle of one side of the board). If you have the Service Manual, there is a board layout that shows all this detail on page 12.

If you are looking in the Instruction Manual, what may be confusing you is that they refer to both ends of the wire that needs to be cut. On page 27, para. 5.5, they give you both ends of the same wire (RF Unit X44-1360-00 connector 6 pin 1, and AF Unit X49-1140-00 connector 6 pin 4), and the name of the signal this wire carries is "TOF". This single wire can be cut anywhere between these two referenced connectors, and this "TX turnoff signal" will then be disabled. I find no reference to the shielded wire you mention.

Although this is a simple modification, there are all the usual safety precautions to take before you do it. Make sure the radio is unplugged from A.C. power for a while before you open it up, and then it is always best to use your voltmeter to check and confirm that ALL the voltages on the power supply board have decayed to zero. When I first worked on my 830, one of the bleeder resistors was open and there was several hundred volts sitting there ready to "zapp" me if I touched it. Just be careful.

After you choose the wire and cut it, I would suggest that you use tape or some means of insulating the two ends of the cut wire.

There are lots of more experienced guys on this reflector than me. If something I said needs to be clarified, I hope they will jump in and do so for your benefit.

Let us know how it works out for you. If you have any more questions, please let us know.

73, Bill, K5GCW

Subject: [TS-520_820_530_830] Re: TS 830S warc bands

According to the manual there are 2 wires to cut. If you got it with 1 I would like to know which one. According to the manual one of them is the center of a shielded wire, and that one makes me a little nervous.

Hi George,

Actually it might have been two (remember, I did this 19 years ago, and my present Kenwood hybrid is an 820), and yes one of them was in the middle of a wire bundle. I was VERY careful when I cut that one. I think I cut it as close to the plug or board it went into, as I could, since I didn't want to take the chance of cutting other wires in the bundle.

Bruce,

The top of an MC-50 or MC-60 unscrews from the body but the pieces are glued together at the factory. You need to apply heat, carefully, to the joint between the top and body. A heat gun works well but a hair dryer might substitute. I wear leather gloves so I can hold the mic while it is being heated and keep trying to unscrew the top as soon as possible.

Before you reattach the top you may want to experiment with placing a thin piece of black paper around the element to reduce the lows from these mics. Varying the amount you cover the "vents" will determine how much the tone changes.

Greetings everyone!

I was surfing the posts for a possible fix for the problems on my Ts-830s when I found this...

I have the following problems: No monitor sound (can hear anything I tx), and the speech processor doesnt work. It does pass tx audio, but the com level only acts as the mic gain pot. It doesnt add anything to the tx audio...

I am not sure if this happened to any other ts-830s user, but any tips on where the problems might be would be very good, since I am a newbie at these things... I can work a soldering iron and a multimeter... so... maybe I can sort this thing out with your help :)

>
> The Processor circuit is on the IF board.
> This processor is a RF processor as it does the compressing at an RF frequency rather than a audio frequency. It does, not work in the IF but instead converts the audio to a sideband signal at a frequency of 455 kHz, compresses it as RF and then converts it back to audio. The theory is that by doing this, the 455 kHz filters will remove the harmonic distortion caused by hard limiting. When the processor is on, Q-22 amplifies the audio and drives a balanced modulator. For the balanced modulator to function it must be supplied a 455 kHz carrier signal. This comes from carrier oscillator Q-28 and Q-29. The 455 kHz carrier signal is on TP-1 and is applied to the balanced modulator through C-130. It is also supplied to a product detector, by way of C-133. After this process is complete, the product detector returns the signal to an audio frequency. If you have a scope available, please let me know. Otherwise measure the voltages on Q-28 and Q-29, and then Q-23, Q-24, and Q-25. This should be done with the radio in SSB transmit and the processor on.
>

> If the circuit is not getting the carrier oscillator signal, it will
not pass audio from input to output. Also check the small filters,
CF-1, CF-2, CF-3 for bad solder connections. Let me know what you find
and we can go from there.

Bruce,

One thing to check is the wiring arrangement from the mic to the rig. Your instruction manual should have drawing that shows the PTT leads being separate from the Mic leads. The Mic "Hot" and Mic "ground" wires should be connected to pins 1 & 4 respectively, and the PTT wires should be connected to pins 2 & 3. There should be in interconnection between the Mic "ground" pin 4 (shield) and either of the PTT wires. While you are checking this out with the covers off the connections, you can check for the bad solder joints you are suspicious of. Good luck.

From: Stephen Goldberg
Topic: 8327 Message: 8331

With the screen switch in the off position and mode in USB and processor off, inject a 1500 Hz signal into the mike input and adjust the MIC gain for max reading on the ALC scale of the meter.

Then, with the same audio signal injected and without changing any of the preceding adjustments turn on the processor and adjust VR3 on the IF board for the same reading on the ALC meter as with the processor off.

I don't have an audio generator and use a steady whistle into the mike for a reference and watch the meter as I switch between off and on and then make a slight adjustment and try again until both match. Get good audio reports and reports of effective compression.

Hope this helps.

Steve W4IMF

Hi Gary,

Perhaps ther is, but I think any improvement would only be incremental. The Kenwood hybrids have very sensitive receivers to begin with. Any subtitution would be mainly for availabilty resons.

With regards to receiver noise - the Kenwood hybrids are actually quite quiet compared to many moden rigs. When I first fired up my TS-820, I was reminded about just how quiet these rig can be. MY IC-703 Plus I used to have, and my present FT-897D, are oftentimes noisier than my TS-820 is under similar band conditions. This is due to 2 factors:

1. The Kenwood hybrids lack the phase noise that most sythesized rigs have.
2. Since the Kenwood hybrids used a tuned receiver front end (peaking the drive also serves to peak the receiver preselector), they do not have the "no tune" broadband receiver front ends modern radios have, and as a result, they better reject out of band signals that would increase the general noise and crud you'd hear in the receiver (the preselector acts in the same a way a 2.4 KHz filter does - it keeps out signals outside if its passband).

Designers of modern receiver front ends know about this, and have tried to deal with this issue, by using DSP (and roofing filters) with varrying degrees of success. You can crank up the DSP, and in many cases, completely eliminate your noise problem, but this comes at a cost - distortion of the signal you're trying to listen to (more so on SSB than CW, due to all of the audio frequencies present in an SSB signal), due to DSP sampling rates (and roofing filter algorithms for that matter) often not being up to the task of maintaining fidelity. Higher end radios try to deal with this by using higher sampling rates, newer software algorithms, and more processing power, but never seem to completely eliminate the distortion issues that heavy DSP (and roofing filter) use can cause. As a result, I typically avoid using DSP on my FT-897D. DSP seems to just be a band-aid fix for modern receivers.

73,
Ellen - AF9J

The 3SK48 is a lower noise, and slightly higher gain sub, for the 3SK35, 3SK40, and 3SK41. It makes a nice difference in your front end. However, finding them, and finding them at a reasonable price today in small quantities, can be a challenge. I replaced the 3SK40/41's in my TS-600, 6M transceiver, and it made a world of difference. However, front end alignment is necessary when making the replacement to take full advantage of their features.

Hi I assume you mean 1.8 filter...I have one and never use it ...it seems that most of the intelligence is in the bass frequencies....no comparison to the effect that the 500cps filter has on CW

8337. Anyone have a CW filter for a 520s available?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-23 20:14:04 UTC
From: Dave
Topic: 8321 Message: 8337

Our local radio club (www.yars.org) was recently given a TS-520s station (with SP-520 and MC-50!) from a ham who's no longer active in the hobby. It seems to be in good shape, and has reasonable output with original S2001 tubes. I'm in the process of cleaning it up and making it ready for a fund-raising sale.

The only thing missing is a CW filter, so if anyone has a spare available for a reasonable amount, please let me know off-list what your price is.

Tnx es 73,
- Dave

"it seems that most of the intelligence is in the bass frequencies" <snip>

Not true. Most of the energy is in the bass fqs - most of the intelligence is in the treble fqs. This from an ex-flightline mechanic with resultant lousy upper-end hearing, who now teaches elementary school. My constant demand is, "children, speak up, and look at me when you're talking to me!". ;>)

From: m_m_maxau
Topic: 8341 Message: 8341

Hey guys.

My Ts820S, that I am restoring has two strange issues:

1) no function in tune, cw or usb and the digital display shows that the pll is not locked (I guess).

It shows:

on all segments of 10m 29.000

On 21mhz, shows 29.000

0n 14mhz shows 19.000 etc

on 7 mhz shows 9.000

on 80 and 160 meters shows 9.000 and on WWv shows 19.000

When the radio is in lsb or fsk the readout works as it should and all is well until you tx:

here is problem number 2)

Receive is fine until you key the mike then receive drops (I guess about 40 db).

The only way to get it back to the level it originally was on is to do the following:

turn the power switch off for a second

then the readout reads (on lsb and fsk) about 400kc higher than when you first key up.

flick the band switch and the frequency jumps back to the correct one and receive is back to normal.

Weird or what?

I am guessing that the problems may be.

a) the connectors from the mode switch to the PLL board?

b) there is a bad cap or solder joint on the pll board?

c) the switch (es) are bad.

Any help would be appreciated.

I would also like to offer a big thank you to Charles on this group who helped with spares for my 820, good on you mate !!!!

73's

Anthony

Topic: 8349 Message: 8349

Thanks all for the help. I will comtinue the work on the alignment of my 520 and then decide how many I need.

I feel I may have some problem as the receiver noise with the antenna disconnected seems a little high. Not having listened to another 520 I have no reference but there is a rather noticeable hiss, more than I had on my Ten-Tec radios when I worked for them in engineering.

May have a bad noisy FET.

Thanks ALL

Gary

If you want to do some tweaking and don't have a good tone generator try NCH frequency generator software for your PC. Generates all types of tones through your sound card, to include sweep and multiple tones. I checked the output with a scope and frequency counter. Tones are fairly clean and on frequency. Output level is adjustable in DB.

Thought this might help someone who doesnt want to put out the bucks for a function generator. Best yet it is freeware!

Gary

G'day Charles

No problems at all, those word were more than deserved, you were a great help mate !

I am slowly getting the old girl up and running, I noticed over the weekend that the driver does not have the black cover, so that is another item I need to chase up, or maybe I can make one up.

It actually appears to hold the earth strap in place as well.

I think I am not too far away from getting her 100% operational.

Take care

73

Anthony

I got mine on e-bay for $90+S&H. I probably paid too much for it,
but the filter is very useful for CW, and I'm still saving a bunch
of cash compared to getting a TS-2000. I think it is a sin for anyone
to remove the filters and sell them separately. The 520 is a great CW
rig with the filter.

Dave

3N211 has been designed for VHF. Should be OK on HF.

See the specs at :
http://www.datasheetcatalog.net/datasheets_pdf/3/N/2/1/3N211.shtml

Main advantage of the 3N211 is the TO 72 case : just plug it (instead of the 3SK35 or 3SK41) and that's all.

Of course, a complete alignment of the Rx is probably necessary.

73" Marc
F1GSN

Note : Je n'ai pas (encore) fait la modif sur mon 520S mais je pense que le gain en terme de bruit (et de gain sur 21 & 28) est très significatif.

8356. TS-820 - No drive on 10m

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-24 15:46:17 UTC
From: Rob Campbell
Topic: 8356 Message: 8356

Help!

Now I've got an antenna up to cover more than just 80/40m I decided to see what was around on 10m at the weekend only to discover there's no drive on that band. None of the three band positions for 10m works, although I can receive there's no drive output at all.

All other bands are OK with at least 100W out key-down on CW.

Any ideas where I should start looking?

Rob (GM6OQN)

8357. Re: [TS-520_820_530_830] Sub for 3SK35Y Thanks all!

A decent scope can help track down the "hiss". The last several rigs that
I worked on that had some type of "hiss" component were traced to issues
in the audio stages of the receiver section.

To ALL my last post spoke about play in tuningknob and whilst this does not affect tunning it gived a poor feel . i had a number off replies but due to my error the advice given was for ts820 and this does not appear to apply to my TS830m ie I hve noo bearing ring etc . .looking carefully the play is due to movement off the brass shaft the knob fits on. this appears to be fixed by circlip and will allow fractional movement when knob raised. it looks as if it should be ok if a firm fix was availiable . presumably there is play in the btm hole! . any thoughts on this Ts830 m sorry!!Bob G8acq

David,

Do you remember the number of turns you counted on the input and output sides of this transformer? Bill the list owner has wondered on a few occasions if anyone has thoughts about making a replacement for this part, which is, I think, the same as L41 on the TS-830, etc. It seems to be a weak link and without replacement parts we're left to rewinding these. Also, if you can, comment on the guage wire used. If you don't have the guage, can you measure the diameter with a micrometer or even a caliper.

Also, if anyone has a loose L41 coil for the 830 can you possibly measure the input and output inductances. This can help identify a suitable core substitute.

Many thanks.

Larry

Hello Rob,

This was an unlucky weekend to me either with the same problem. Mine is a TS-530SP but the problem is common technically. Your rotary switch (wafer switch) may cause it and the coupling is also suspect in the PA cage.
A good maintenance would do with cleaning and using contact spray. In addition check coupling whether it is not cracked or flipperty-flopperty.

Do clean PA cage from dust if any inside.

Take care of high voltage rest in caps!

Does anyone have the instruction manual for the AT-230 tuner? Maybe
it could be uploaded into the files section. Would like to know the
particulars about it. Still using the MFJ for now. Thanx George W7zvd

Hi, Tibi.

Many thanks for your advice. I'll have a look but it will have to wait till the weekend before I can spend much time on it. I'll need to make up a shunt to discharge the HT caps first though. What's recommended?

The wafer switch contacts sound likely now I've had time to think - given the low activity on 10m these positions probably haven't been used in years (I've had the radio 2 years and have never used 10m!). I've seen a contact cleaner recommended on this group but wonder if it's available in the UK and if not what a good substitute might be?

Rob (GM6OQN)

Hi Rob,

Sure, you have to devote time for doing the job. I prepare myself to do a full maintenance after RSGB IOTA. Generally every half year it is advised to do so in accordance with the manual.

Well, just disconnect the rig from mains. When PA cage is open, take a piece of cable with clips on both ends. First connect to the ground (firmly to the chassis), then to the anode choke. There may be a spark, but do not worry, caps are discharging. Keep this short circuit until you are working in the PA cage.

The coupling is of plastic and synchronies the band switch system with the arresting device in the PA cage. Loosing synchrony means loosing several (or all) bands. If it is cracked and you cannot fix it you can replace it with the coupling of the Load if it was the same type. The coupling in the cage transfers the force when you change band while the coupling of the Load is just a coupler of a variable cap where there is no mechanical force.

It would be the worse case.

The easier case is dirt and oxidation on wafer switch.

If you choose one contact cleaner just read the product description. If it is offered for electronic use, it will do. We have different brands in both Europe and US. Buy what you can find proper at your local dealer.

My TS-530SP sometimes tricks me with dead 7 MHz, 24 MHz and now with 28 MHz even though I have worked much on 10 m during this ES season. Great radios are the KNWD hybrids but as vintage equipment they need special care, hi.

Hope you get back 10 m. Let me know any further development.

Tibi, HA2MN

Rob,

DeOxit is the recommended switch/cleaner lubricant. In the UK it is available from www.stoneaudio.co.uk/default.asp?redirect=http://www.stoneaudio.co.uk/stoneaudio/products/details.asp?product=311. I recently bought an aerosol can - it is expensive, with postage about £18 (for US readers who would like a comparison, that's about $34).

The bandchange switch of my TS530SP was intermittent on a couple of bands, so I sprayed the wafers and the problem has not returned. I had previously used a Servisol switch cleaner from Maplin.. Time will tell whether the DeOxit has solved the problem longer term.

You might also consider changing the 12BY7A. I had no ALC indication on 10m, but a new driver fixed the problem. Waters and Stanton sell the 12BY7A. Their web site shows a photograph of an NEC branded tube. I bought two on the strength of this but the ones supplied were a brand I did not recognise, although made in the USA. The one I fitted worked fine with plenty of drive on 10m.

73s,

Richard G3OTK

I leave these off; it helps keep the 12BY7 cool, and I have never observed any problems with the driver being unshielded; any tubes that I have used that were a little "wild" either calmed down when I removed the shield, or stayed the same; changing the tube would do the trick in that case.

By the way guys when you are buying driver tubes, always get a couple or five, preferably of different manufacturers; sometimes a particular radio does not like a particular tube, as evidenced by jumps in plate current or ALC reading when turning the drive or preselector tuning from one end of travel to the other. In this case, just change the driver until you find one that is stable. Save the others for someone else's rig, don't throw them out!

Further thoughts; peaking of this coil on 160M is usually not productive, so it would appear that just doing a match with a toroid may be sufficient both for the 160m band, and for matching to hi-Z for all the other bands; this would greatly simplify things if we could do a small toroid.

I think the paid version does two tones... ideal!

I use NCH to tune my gee-tars.

Bill, K0ZL suggests removing the shield anyway for better cooling. I've not tried it, but he is the man on these rigs. So I wouldn't worry about the shield if it is gone.

I put an INRAD 2.8 filter in my TS 820. I am particular about sound, but It made my receive much better. Yes, I mean 2.8. I tried a 1.8 some years ago. Sounds like I have wet cotton in my ears.

You play guitar too Bill? I'm looking to ge back in a semi-pro band
to earn some extra money. Hmmmm, I guess I'm not the only guitarist
in the group. But tuning an axe with NCH - that's a new one for me.

73 & play on,
Ellen - AF9J

8373. Re: Missing 12BY7 shield

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-25 14:52:04 UTC
From: Ellen R
Topic: 8370 Message: 8373

It makes sense to me. I've had other rigs that used 12BY7s (and 12BY7As), and none of them had sheilding cans around them. They worked just fine. I've been kind of wondering about heat dissipation with that shield. Heat is the enemy of any tube.

All too often, the driver tube is blown off with regards to importance in these rigs. I've had more than a few times where just changing the 12BY7 made all of the difference in the world. A good idea that the 12BY7 is going goofy, is a lack of drive on the higher bands, or the fact that it seems to peak a little weird (say higher up in the bandspread range than it should) . I've been thinking of changing mine, because of this issue - my drive is getting kind of wimpy (only about 90W) on 20m and higher. They're relatively cheap, and Bill is right, different brands will act differently in the same radio. I had a Drake T4XC years ago that gave me better drive with GE tubes, than the one Mullard I got for it from a local electronics store.

Not to jump on Bill's back, but I guess I could also take the metal frame shields away from the final compartment too and it would probably provide better air flow. Heck, if I take the top and bottom covers off, I'd have even better air flow. The purpose of the shields is to prevent unwanted RF radiation from getting into places where they shouldn't be. The 12BY7 does radiate sufficient RF energy without the grounded shield that could cause a problem at some frequencies. Other circuitry is fairly close to the area of the 12BY7 which could be affected. If you can find a similar shield, or even make one, I would use it.

Just downloaded the free NCH tone generator. It does up to 16 tones at
once, each at their own level. Look on TONES on the menu bar.

I think the paid version does two tones... ideal!

I use NCH to tune my gee-tars.

8377. How to Question on TS-520S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-25 22:38:58 UTC
From: K4MT
Topic: 8377 Message: 8377

I have been troubleshooting a problem with WWV t
recieve. I had sevier noise sounding like static crashes even
with no antenna. I discovered that one of the FETs for WWV has a
bad solder connection. Simply moving it around into the right
position stops the noise.

Now my question. How do you go about removing the RF board? The
chains and gears and all the shafts etc seem like a nightmare.
Anyone done this and any tips to stop me from pulling out my
last hair?

Thanks

Gary

Hi Anthony,
Sounds like a simliar problem I had on a TS-820 not long ago.
The first problem was due to bad contacts inside the Digital display box. I carefully removed it (4 screws) and then took the cover off the unit. I then seperated the boards and cleaned all the contacts with De-Oxit. After I put it back together, I also cleaned the upper and Lower connectors. That solved the 29.000 and the 9.000 and then WWV was right on.
The second problem sounds very much like the issue I had also. It turned out to be some brokem terminals INSIDE the connectors on the relay Board and on the AF-AVR board. might try wiggling all those connectors and see if you can locate the bad one. it worked for me when trying to locate The issue I had. I also found some broken terminals on the RF unit connectors also.

Hope this helps a bit.
73,
Gordon

Go underneath!

I think the audio unit comes away, then there is an access plate under neath
that will allow access to the bottom of the RF unit when the plate is
removed.

G'day Gordon

Thanks mate for the tips.

I really want to get the old girl going, I have had a great deal of help from another member of this group, Charles in Western Australia.

he has been tremendous.

I really appreciate all of the help.

Charles here
sorry don't have a cover
but according to bill ((he is one of the gurus and one of the founders
of this site)) I am inclined to go with what he says bill please the
metal strip that runs up the side of the 12by7 do you let it float in
fresh air or do you clip it to the 12by7 with small clips please what was
the original idea of this strip thanks bill Charles & rusty

G'day Charles

Thanks for looking mate, much appreciated.

I will follow Bills advice.

I need to get stuck into it when I get some time. hopefully this weekend.

Thanks again mate

73
Anthony

hallo Anthony
Charles here
sorry don't have a cover
but according to bill ((he is one of the gurus and one of the founders
of this site)) I am inclined to go with what he says bill please the
metal strip that runs up the side of the 12by7 do you let it float in
fresh air or do you clip it to the 12by7 with small clips please what was
the original idea of this strip thanks bill Charles & rusty

Topic: 8207 Message: 8385

Bill,

Gordon says 6 primary and 26 secondary turns of what looks like #40 enameled. My guess is that some kind of ferrite is used on this, but possibly powdered iron given the low frequency. At higher frequencies, the magnetic material would have less of an effect, depending more on the mutal coupling of the primary and secondary. Given that the coil seems to resonate against a 220pf cap and is loaded by 10K at 160meters, I can determine the type of material needed to do this with a small torroid. In aligning the antenna coils is there interaction between setting up the 160 meter coil and the ones on higher frequencies --especially 80 meters? If so, then some kind of tuning capability would possibly be best, but I think a fixed coil and a small variable Cap in parallel with the 220 pf cap (may need a small change in value there -- say 200pf with a 40pf variable) could do the trick.

I'll get back on this after I do some noodling.
